DESCRIPTION & OPERATION

POWER LUMBAR SUPPORT SYSTEM DESCRIPTION

Overview

The power lumbar support motor winds up the wire connected to the lumbar support, then the shape of lumbar support is changed and pushed forward. The lumbar support wire pushes the wire out to return to the original position.

SEAT HEATERS SYSTEM DESCRIPTION

Control/Function

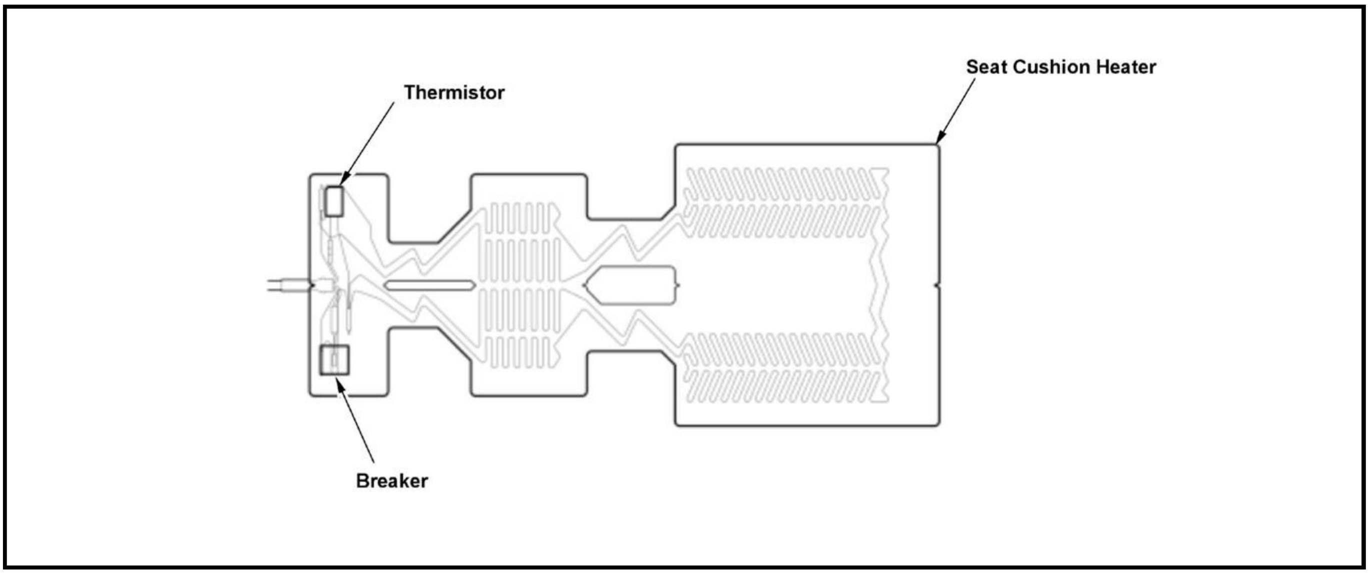
The front seat heater control unit sets the seat heater to High/Mid/Low or OFF based on the seat heater switch signals received from the climate control unit via B-CAN. The front seat heater control unit monitors the thermistor resistance, the voltage/current/temperature to the heater, and the presence of communication with the climate control unit. Also, the system stores DTCs when a malfunction is detected in the front seat heater control unit.

Automatic Operation

Based on the outside air temperature, A/C target temperature and other factors, the climate control unit calculates the optimal front seat heater setting. The climate control unit sends this setting request to the front seat heater control unit via B-CAN. When operating in auto mode or during remote engine start, the front seat heater control unit will operate per B-CAN setting request from the climate control unit.

Thermistor and Breaker

The seat cushion heater has a thermistor and breaker. The thermistor and breaker protect the seat heater circuit from overheating. The value of the thermistor is inputted to the control unit.



The seat heater temperature is controlled by breaker ON and OFF condition.

B	ON	OFF
Breaker	95 - 113 deg.F (35 - 45 deg.C)	115 - 129 deg.F (46 - 54 deg.C)

Failsafe Function

Thermistor Circuit Open Failure

Thermistor circuit open refers to a condition in which the value of the thermistor built in the seat cushion heater continues to be higher than the threshold value for a few seconds. When the control unit detects a shift from the normal operation condition to this condition, it stops the seat heater operation and turns off the seat heater switch indicators.

Thermistor Circuit Short Failure

Thermistor circuit short refers to a condition in which the value of the thermistor built in the seat cushion heater continues to be lower than the threshold value for a few seconds. When the control unit detects a shift from the normal operation condition to this condition, it stops the seat heater operation and turns off the seat heater switch indicators.

Heater Circuit Current Error

When the control unit detects an abnormal current value in the heater circuit, it stops the heater output immediately after detection and turns off the seat heater switch indicators.

GENERAL INFORMATION

SEAT HEATERS SELF-DIAGNOSTIC FUNCTION

NOTE: The seat heater control unit has a thermistor self-diagnostic function. It indicates the result by lighting the LEDs of the seat heater switch.

- The seat heater control unit have a self-diagnostic function.
- The self-diagnosis is performed for control unit.
- Use the seat heater switch to perform the self-diagnosis and read the trouble history.

How to Use the Self-Diagnostic Function

NOTE: Do steps 2-3 within 10 seconds after doing step 1.

1. Turn the vehicle to the ON mode.

2. While pressing the left seat heater switch, press the right seat heater switch three times.

3. Release the left seat heater switch, and press the right seat heater switch three times.

4. When the system enters the self-diagnostic mode, all of the seat heater switch indicators turn on for 2 seconds.

5. All of the seat heater switch indicators alternatively turn on and off every 2 seconds during self-diagnosis. If any DTC is stored, the system shifts to the LED pattern, which will continue to blink every 2 seconds until the vehicle is turned to the OFF (LOCK) mode. If no DTCs are stored, the system shifts to the normal control.

- During self-diagnostic mode, the control unit blinks the seat heater switch indicators in a specific pattern corresponding to the failure.
- One DTC is displayed four times. If more than one failure exists, the next DTC is displayed after 2 seconds.
- After all patterns are displayed, the cycle will be repeated until the self-diagnostic mode is off.
- The DTC is displayed on either seat heater switch according to where the failure has occurred.
- The DTC is displayed using the seat heater switch indicator for the seat in which the failure has been detected.

How to Check for History DTCs

The seat heater control unit can record history DTCs. To read the history DTCs.

NOTE: Do steps 2-3 within 10 seconds after doing step 1.

1. Turn the vehicle to the ON mode.

2. Press the left seat heater switch three times.

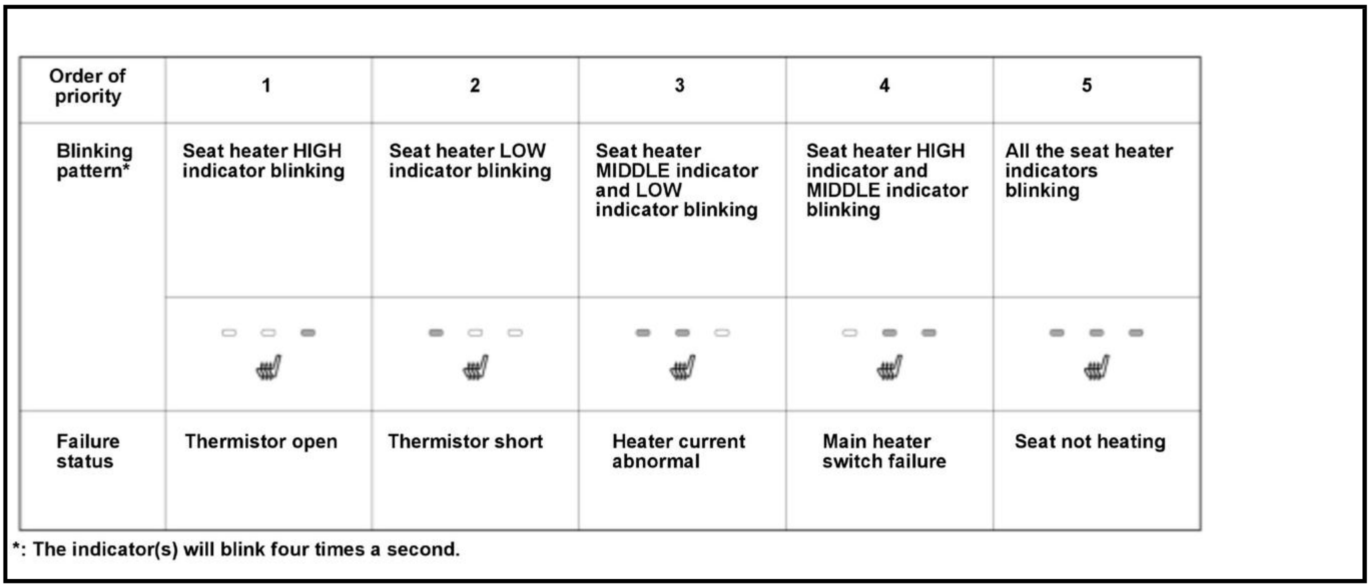
3. Press the right seat heater switch six times.

4. Press the left seat heater switch three times.

5. When the system enters the trouble history read mode, all of the heater seat indicators turn on for 3 seconds. If any DTC is stored, the system shifts to the LED pattern, which will continue to blink every 2 seconds until the vehicle is turned to the OFF (LOCK) mode. If no DTCs are stored, the system shifts to the normal control.

- During self-diagnostic mode, the control unit blinks the seat heater switch indicators in a specific pattern corresponding to the failure.
- One DTC is displayed four times. If more than one failure exists, the next DTC is displayed after 2 seconds.
- After all patterns are displayed, the cycle will be repeated until the self-diagnostic mode is off.
- The DTC is displayed on either seat heater switch according to where the failure has occurred.
- The DTC is displayed using the seat heater switch indicator for the seat in which the failure has been detected.

Indicator Blink Patterns



Order of priority	1	2	3	4	5
Blinking pattern*	Seat heater HIGH indicator blinking	Seat heater LOW indicator blinking	Seat heater MIDDLE indicator and LOW indicator blinking	Seat heater HIGH indicator and MIDDLE indicator blinking	All the seat heater indicators blinking
	○ ○ ●	● ○ ○	● ● ○	○ ● ●	● ● ●
Failure status	Thermistor open	Thermistor short	Heater current abnormal	Main heater switch failure	Seat not heating

*: The indicator(s) will blink four times a second.

How to Clear the DTCs

Whenever the control unit detects failures (failure main heater switch, abnormal heater current, and/or seat not heating), each failure is stored in the control unit.

To clear the DTCs, press and hold the switch for the seat to be cleared for 6 seconds.

NOTE:

- When the driver's side (or passenger's side) is cleared, only the DTCs for the applicable side will be cleared.
- After clearing the DTCs, all seat heater indicators will turn on for 2 seconds, and then go off.
- A thermistor open or a thermistor short failure is stored only when the vehicle ignition in the ON mode. After the vehicle turns to the OFF (LOCK) mode, it is cleared.
- If an open or short circuit failure occurs in the thermistor, the self-diagnostic mode display will be displayed after turning the vehicle to the ON mode.

Ending the Self-Diagnostic Function

Turn the vehicle to the OFF (LOCK) mode.

DESCRIPTION AND OPERATION

POWER LUMBAR SUPPORT SYSTEM DESCRIPTION

Overview

The power lumbar support motor winds up the wire connected to the lumbar support, then the shape of lumbar support is changed and pushed forward. The lumbar support wire pushes the wire out to return to the original position.

SEAT HEATERS SYSTEM DESCRIPTION

Control/Function

Front Seat Heaters

The front seat heater control unit sets the seat heater to High/Mid/Low or OFF based on the seat heater switch signals received from the climate control unit via B-CAN. The front seat heater control unit monitors the thermistor resistance, the voltage/current/temperature to the heater, and the presence of communication with the climate control unit. Also, the system stores DTCs when a malfunction is detected in the front seat heater control unit.

Rear Seat Heaters

The rear seat heater control unit receives a switch signal and controls the temperature setting (High/Mid/Low) based on the value of thermistor built in the rear seat heater. When a certain period of time has elapsed after the thermistor value reaches the threshold value, the rear seat heater control unit automatically lowers the set temperature to one lower level.

Rear seat heater control unit has a self-diagnostic function related to the thermistor.

Automatic Operation

Based on the outside air temperature, A/C target temperature and other factors, the climate control unit calculates the optimal front seat heater setting. The climate control unit sends this setting request to the front seat heater control unit via B-CAN. When operating in auto mode or during remote engine start, the front seat heater control unit will operate per B-CAN setting request from the climate control unit.

Thermistor and Breaker

The seat cushion heater has a thermistor and breaker. The thermistor and breaker protect the seat heater circuit from overheating. The value of the thermistor is inputted to the control unit.

INPUT TEST

FRONT SEAT HEATER CONTROL UNIT INPUT TEST

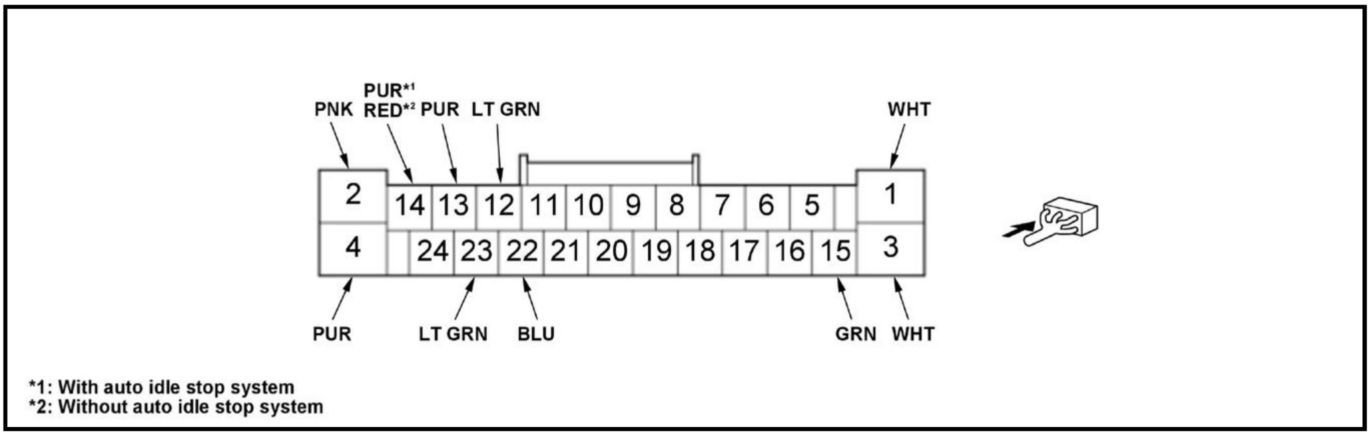
NOTE:

- Make sure the fuses associated with the system are OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .
- Before testing, do the **seat heater control unit self-diagnostic function**, and make sure the seat heater function is OK.

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the front seat heater control unit 24P connector.

Front Seat Heater Control Unit 24P Connector (female terminals)



*1: With auto idle stop system
*2: Without auto idle stop system

Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose or corroded, repair them as necessary, and recheck the system.
- If the terminals look OK, go to step 4.

Reconnect the front seat heater control unit 24P connector, and do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

Cavity	Wire	Test condition	Test: Desired result	Possible cause if desired result is not obtained
2	PNK	Vehicle ON mode	Measure the voltage to ground: There should be battery voltage.	• Faulty front seat heater relay circuit • An open or high resistance in the wire
14	PUR* 1RED* 2	Vehicle ON mode	Measure the voltage to ground: There should be battery voltage.	An open or high resistance in the wire
4	PUR	In all power modes	Measure the voltage to ground: There should be less than 0.2 V.	• Poor ground (G402) • An open or high resistance in the ground wire
1	WHT	Vehicle ON mode, driver's seat heater ON mode	Measure the voltage to ground: There should be battery voltage.	• Faulty driver's seat heater • Poor ground (G502) or an open in the ground wire • An open or high resistance in the wire

DRIVER'S POWER SEAT MOTOR TEST

Test

NOTE: SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

1. **Driver's Seat Recline Cover - Remove**

   NOTE: When removing the driver's seat recline cover, you do not need to remove the driver's seat.

2. Driver's Power Seat Motor - Test

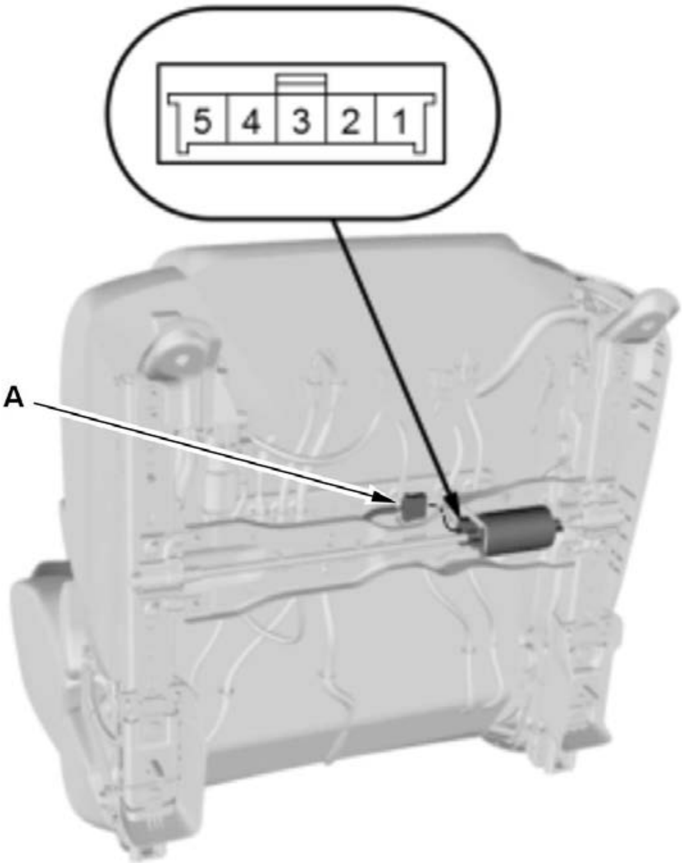
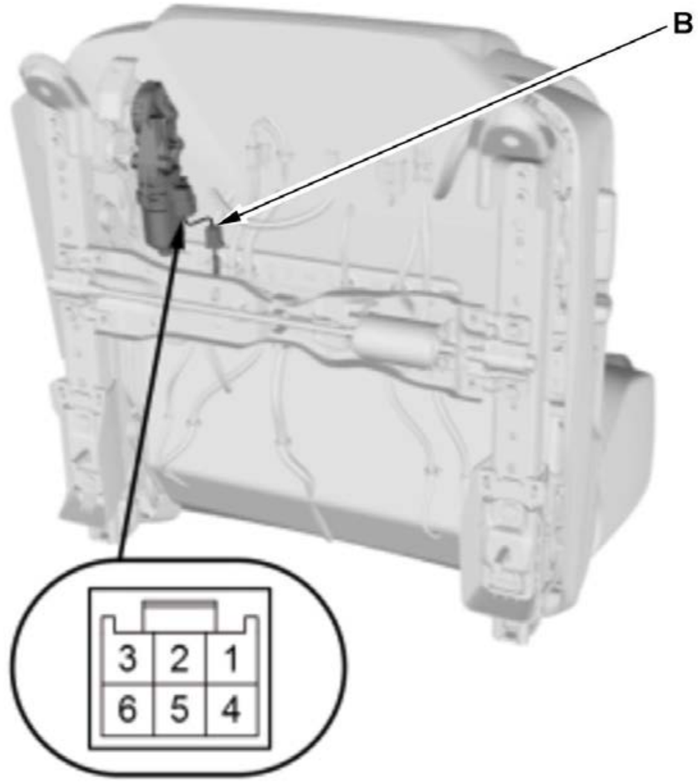
NOTE: Before testing, make sure not to short the power seat circuit.

1. Test the motor by applying power and ground at the power seat control unit/power seat adjustment switch connector B (12P) on the seat harness according to the table. When the motor stops running, disconnect 12 volt battery power immediately.

2. If the motor does not run or fails to run smoothly, **remove the driver's seat** , go to step 3.





3. **Remove the driver's seat-back cover/pad as needed** .

4. Disconnect the following connectors:

- Slide motor 5P connector (A)
- Front up-down motor 6P connector (B)
- Rear up-down motor 6P connector (C)
- Recline motor 6P connector (D)

5. Test each motor in each direction by connecting power and ground according to the table. When the motor stops running, disconnect 12 volt battery power immediately.

6. **If any motor fails to run or run smoothly, replace the seat frame**

If the motor runs smoothly, replace the driver's seat wire harness.

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. Driving Position Memory - Clear

1. After testing, **clear the driving position memory** .

FRONT PASSENGER'S POWER SEAT MOTOR TEST

GENERAL INFORMATION

SEAT HEATERS SELF-DIAGNOSTIC FUNCTION

NOTE: The seat heater control unit has a thermistor self-diagnostic function. It indicates the result by lighting the LEDs of the seat heater switch.

- Both the front seat heater control unit and the rear seat heater control unit have a self-diagnostic function.
- The self-diagnosis is performed for each control unit.
- Use the front seat heater switch to perform the self-diagnosis and read the trouble history on the front side.
- Use the rear seat heater switch to perform the self-diagnosis and read the trouble history on the rear side.

How to Use the Self-Diagnostic Function

NOTE: Do steps 2-3 within 10 seconds after doing step 1.

1. Turn the vehicle to the ON mode.

2. While pressing the left seat heater switch, press the right seat heater switch three times.

3. Release the left seat heater switch, and press the right seat heater switch three times.

4. When the system enters the self-diagnostic mode, all of the seat heater switch indicators turn on for 2 seconds.

5. All of the seat heater switch indicators alternatively turn on and off every 2 seconds during self-diagnosis.

6. If any DTC is stored, the system shifts to the LED pattern, which will continue to blink every 2 seconds until the vehicle is turned to the OFF (LOCK) mode. If no DTCs are stored, the system shifts to the normal control.

- During self-diagnostic mode, the control unit blinks the seat heater switch indicators in a specific pattern corresponding to the failure.
- One DTC is displayed four times. If more than one failure exists, the next DTC is displayed after 2 seconds.
- After all patterns are displayed, the cycle will be repeated until the self-diagnostic mode is off.
- The DTC is displayed on either seat heater switch according to where the failure has occurred.
- The DTC is displayed using the seat heater switch indicator for the seat in which the failure has been detected.

How to Check for History DTCs

The seat heater control unit can record history DTCs. To read the history DTCs.

NOTE: Do steps 2-3 within 10 seconds after doing step 1.

1. Turn the vehicle to the ON mode.

2. Press the left seat heater switch three times.

3. Press the right seat heater switch six times.

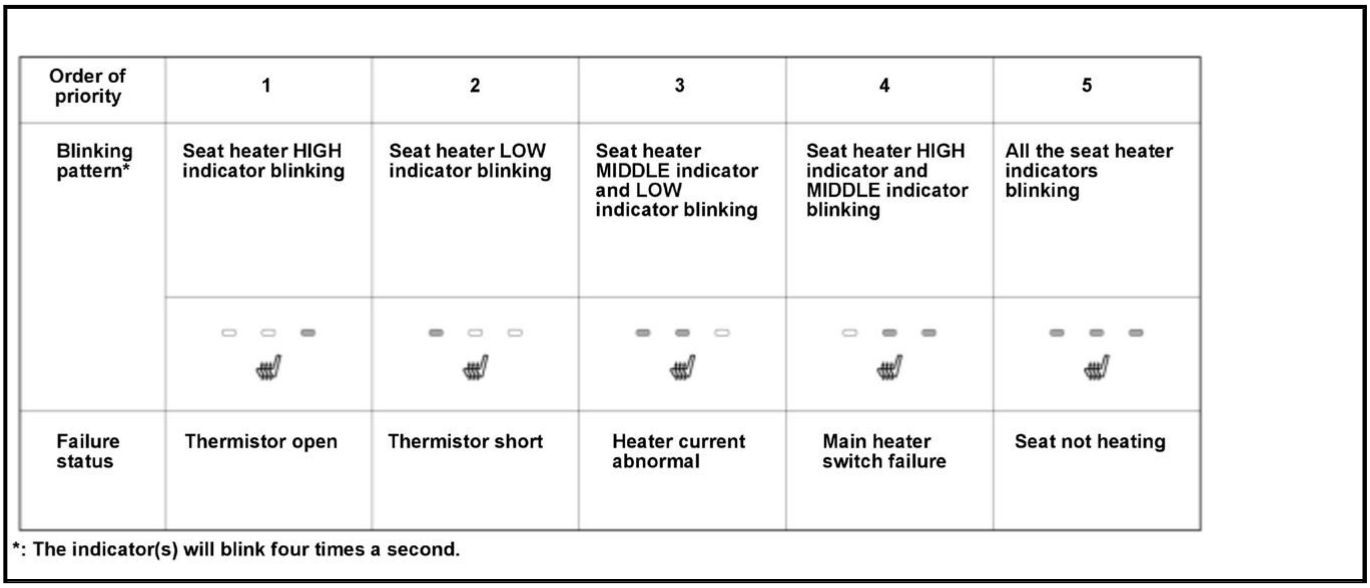
4. Press the left seat heater switch three times.

5. When the system enters the trouble history read mode, all of the heater seat indicators turn on for 3 seconds.

6. If any DTC is stored, the system shifts to the LED pattern, which will continue to blink every 2 seconds until the vehicle is turned to the OFF (LOCK) mode. If no DTCs are stored, the system shifts to the normal control.

- During self-diagnostic mode, the control unit blinks the seat heater switch indicators in a specific pattern corresponding to the failure.
- One DTC is displayed four times. If more than one failure exists, the next DTC is displayed after 2 seconds.
- After all patterns are displayed, the cycle will be repeated until the self-diagnostic mode is off.
- The DTC is displayed on either seat heater switch according to where the failure has occurred.
- The DTC is displayed using the seat heater switch indicator for the seat in which the failure has been detected.

Indicator Blink Patterns



Order of priority	1	2	3	4	5
Blinking pattern*	Seat heater HIGH indicator blinking	Seat heater LOW indicator blinking	Seat heater MIDDLE indicator and LOW indicator blinking	Seat heater HIGH indicator and MIDDLE indicator blinking	All the seat heater indicators blinking
	○ ○ ●	● ○ ○	● ● ○	○ ● ●	● ● ●
Failure status	Thermistor open	Thermistor short	Heater current abnormal	Main heater switch failure	Seat not heating

*: The indicator(s) will blink four times a second.

How to Clear the DTCs

Whenever the control unit detects failures (failure main heater switch, abnormal heater current, and/or seat not heating), each failure is stored in the control unit.

To clear the DTCs, press and hold the switch for the seat to be cleared for 6 seconds.

NOTE:

- When the driver's side (or passenger's side) is cleared, only the DTCs for the applicable side will be cleared.
- After clearing the DTCs, all seat heater indicators will turn on for 2 seconds, and then go off.
- A thermistor open or a thermistor short failure is stored only when the vehicle ignition in the ON mode. After the vehicle turns to the OFF (LOCK) mode, it is cleared.
- If an open or short circuit failure occurs in the thermistor, the self-diagnostic mode display will be displayed after turning the vehicle to the ON mode.

Ending the Self-Diagnostic Function

Turn the vehicle to the OFF (LOCK) mode.

REMOVAL, INSTALLATION & TEST

KEYLESS ACCESS REMOTE REMOVAL, INSTALLATION, AND TEST

Test

NOTE:

- If the doors do not lock or unlock with the remote, check the LED on the remote by pressing the lock or unlock button. If the LED does not come on, replace the remote battery.
- If the doors unlock or lock with the remote, but the LED on the remote does not come on, the LED is faulty; replace the remote.
- If any door is open, you cannot lock the doors with the remote.
- If you unlocked the doors with the remote, but do not open any of the doors within 30 seconds, the doors relock automatically.
- The doors will only lock or unlock with the exception of the remote if the power is in OFF mode.

1. Remote - Test

	1. Open the remote and check for water damage.
	- If you find any water damage, replace the remote and **register the new remote** .
	- If there is no water damage, go to step 2.
	2. Replace the remote battery (A) with a new one (CR2032), and try to lock and unlock the doors with the remote by pressing the lock or unlock button at least 10 times:
	- If the doors lock and unlock, the remote is OK.
	- If the remote does not work after replacing the remote battery, verify that the correct battery was installed and the polarity is correct.
	- If the doors still do not lock and unlock, go to step 3.
	3. **Reprogram and register the remote** , then try to lock and unlock the doors.
	- If the doors do not lock and unlock, substitute a known-good remote and recheck. If it is still not operating, **replace the body control module** .
	- If the doors lock and unlock, the remote is OK.
	- If the doors do not lock and unlock, try to program another vehicle using the remote.
	-
	    - If the remote programs another vehicle, **go to B-CAN System Diagnosis Test Mode A** .
	    - If the remote will not program another vehicle, replace it.

    If the remote will not program another vehicle, replace it.

KEYLESS ENTRY TRANSMITTER REMOVAL, INSTALLATION, AND TEST

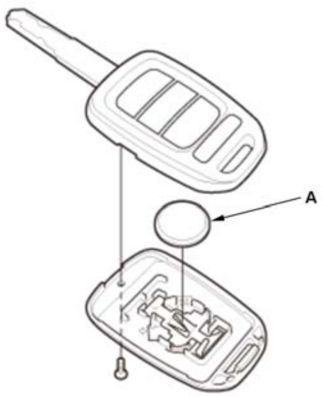
Test

NOTE:

- If the doors do not lock or unlock with the transmitter, check the LED on the transmitter by pressing the lock or unlock button. If the LED does not come on, replace the transmitter battery.
- If the doors unlock or lock with the transmitter, but the LED on the transmitter does not come on, the LED is faulty; replace the transmitter.
- If any door is open, you cannot lock the doors with the transmitter.
- If you unlocked the doors with the transmitter, but do not open any of the doors within 30 seconds, the doors relock automatically.
- The doors will only lock or unlock with the transmitter if the ignition key is inserted in the ignition key cylinder.

Without HDS

1. Transmitter - Test



1. Open the keyless transmitter and check for water damage.

- If you find any water damage, replace the transmitter and register the new transmitter .
- If there is no water damage, go to step 2.

2. Replace the transmitter battery (A) with a new one (CR1620), and try to lock and unlock the doors with the transmitter by pressing the lock or unlock button at least 10 times:

- If the doors lock and unlock, the transmitter is OK.
- If the transmitter does not work after replacing the transmitter battery, verify that the correct battery was installed and the polarity is correct.
- If the doors still do not lock and unlock, go to step 3.

3. Reprogram and register the transmitter , then try to lock and unlock the doors.

- If the doors lock and unlock, the transmitter is OK.

	• If the doors do not lock and unlock, substitute a known-good transmitter, register it and recheck. If still not operating, replace the immobilizer-keyless control unit.

With HDS

2. Transmitter - Test

	1. Press the transmitter lock or unlock button at least 10 times to reset the transmitter. • If the locks work, the transmitter is OK. • If the transmitter does not work after replacing the transmitter battery, verify that the correct battery was installed and the polarity is correct. • If any of the transmitter buttons do not work, replace the transmitter, then register the transmitter . • If the locks don't work, go to step 2. 2. Connect the HDS to the data link connector (DLC) 3. Select KEYLESS TRANSMITTER from the BODY ELECTRICAL menu, then select INSPECTION, then KEYLESS CHECK. 4. Press the lock, unlock, or HOLD button and check the response on the screen of the HDS. **NOTE:** The door lock actuators may or may not cycle when receiving input from the transmitter. • If KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the transmitter is OK. • If DIFFERENT KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is working but indicated, the transmitter is not registered to the vehicle. If necessary, register the transmitter . • If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, go to step 5. 5. Open the transmitter and check for water damage. • If you find any water damage, replace the transmitter, then register the new transmitter . • If there is no water damage, go to step 6. 6. Replace the transmitter battery (A) with a new one (CR1620), and press the transmitter lock or unlock button and check the response on the screen of the HDS. • If KEYLESS ENTRY TRANSMITTER CODE IS RECEIVED is indicated, the transmitter is OK. • If KEYLESS ENTRY TRANSMITTER CODE IS NOT RECEIVED is indicated, go to step 7. 7. Use a different known-good transmitter and repeat steps 3 and 4.

	NOTE: The transmitter does not need to be programmed to the vehicle for this test. • If DIFFERENT KEYLESS ENTRY TRANSMITTER CODE WAS RECEIVED is indicated, replace the transmitter and, do the transmitter registration . • If KEYLESS ENTRY TRANSMITTER CODE WAS NOT RECEIVED is indicated, the immobilizer-keyless control unit is faulty, replace it and do the transmitter registration . **NOTE:** The transmitter is combined with the immobilizer transponder, so when the transponder is registered by the HDS, the transmitter programming is completed automatically.

DESCRIPTION & OPERATION

KEYLESS ACCESS SYSTEM DESCRIPTION

Smart Entry Function

The body control module detects the input signal of the door outer handle touch sensor, the outer handle lock switch, the tailgate outer handle switch, or the tailgate lock switch, and authenticates 2-way communication with the remote. The body control module then activates the door lock actuators or tailgate release actuator, and an answer back. In addition, vehicles equipped with the power tailgate send the smart unlock permission signal. The body control module also activates the tailgate release actuator when the tailgate outer handle switch is pressed. For details on the illumination patterns of the warning lights and the functional check of the system, refer to **keyless access system symptom troubleshooting information**.

Remote Search Function

The function determines if the remote is present inside the vehicle during certain operations or functions. It also detects when the door is opened and closed with the vehicle in the ACCESSORY/ON mode. When the remote is taken out of the vehicle, the keyless buzzer will sound and the gauge control module (Only when the vehicle is in the ON mode) will show a warning.

Backup Communication Function

When key authentication between the remote and the body control module is not possible because of a system abnormality or a drop of the battery voltage of the remote, the immobilizer function can be canceled by pressing the power switch once and bringing the remote close to the power switch while the light (white) of the power switch is flashing. This causes the immobilizer signal to be sent to the body control module via the LF antenna of the power switch.

Remote Engine Start System

Start the Engine

The remote engine start feature is initiated by first pressing the lock button, then pressing and holding the "START" button within 5 seconds on the remote transmitter. An RF signal from the remote transmitter is received by the body control module, which then sends the request to start the engine to the PCM. At the same time, the body control module authenticates the key for the immobilizer system. The PCM starts the engine and sends feedback to the body control module indicating the status of the engine.

Remote Engine Start Link

According to outside air temperature, the climate control, the rear window defogger, the seat heater, and the mirror defogger* operate while the remote engine start is operating.

Key Lockout Prevent Function

The body control module monitors whether or not there is the remote in the vehicle. If the remote is in the vehicle, the system will not lock the doors. The non-selectable unlock function: If the driver manually locks and closes the doors with the remote in the vehicle, the body control module energizes the all door lock actuators and unlocks the all doors. The selectable unlock function: If the driver manually locks and closes the doors with the remote in the vehicle, the body control module energizes the driver's door lock actuator and unlocks the driver's door. In addition, when the keyless lockout prevent function operates, the answer back is performed.

Immobilizer Function

The immobilizer function provides mutual authentication between the body control module, the PCM, and the VSA modulator-control unit in the turn the vehicle to the ON mode. The engine stays running after engine start-up if the immobilizer signal matches. The body control module authenticates the VSA modulator-control unit and the immobilizer signal only one time, when the vehicle is turned to the ON mode after resetting of the battery, removing and installing the back-up fuse or removing and installing the VSA modulator-control unit. For some model, the brake pedal must be depressed to perform the immobilizer authentication.

Alarm Function

Detects if the door is opened or closed while the vehicle in the ACCESSORY or ON mode. When the remote is taken out of the vehicle, the keyless buzzer will sound and the gauge control module (Only when the vehicle is in the ON mode) will show a warning. Before the remote battery level falls to the point where the remote cannot be detected, the gauge control module will show a warning and an alarm will sound.

Registration Facility

The body control module can store up to 6 remotes using the HDS.

Fault Diagnosis Function

The system has a fault diagnosis function. If any malfunction occurs, the keyless access indicator comes on in the gauge control module.

Customer Emergency

When the power switch is pressed continuously at least three times or once for 1.5 seconds or longer in an emergency while driving, the engine turns off, and the vehicle mode switches to the ACCESSORY mode. Furthermore, pressing the power switch while driving will set off a buzzer several times in order to avoid unintended operation of the power switch.

Panic Function

When you press the PANIC button on the remote, the body control module sounds the horn, and activates the exterior lights.

Walk Away Auto Lock Function (If Equipped)

The walk away auto lock system detects where the remote is and locks all doors and the tailgate when all the doors and the tailgate are closed and the remote is outside of the vehicle and out of the range. To operate the walk away auto lock system, it is necessary to enter the auto lock mode. To enter the auto lock mode, the following conditions must be met:

- The vehicle is turned to the OFF (LOCK) mode.
- All doors including the tailgate are closed.
- The remote is outside but within 1.5 m (5 ft) from the vehicle.

Once the system enters the auto lock mode, the keyless beeper sounds once. When the remote is carried beyond 1.5 m (5 ft) from the vehicle and remains outside of this range for more than 2 seconds, the system engages and locks all of the doors including the tailgate. At that time, the keyless buzzer sounds and some exterior lights will flash. However, if the remote remains within 1.5 m (5 ft) from the vehicle for 30 seconds or more after entering the auto lock mode, the doors and tailgate will automatically lock.

The system does not work under the following conditions:

- The remote is inside of the vehicle.
- If the remote is away more than 1.5 m (5 ft) from the vehicle after closing all the doors and tailgate.
- If a communication error occurs between the remote and the vehicle.

The following conditions will cause a delay for the system to engage:

- If a door or the tailgate is opened after the system enters the auto lock mode.
- If the power tailgate is not fully closed.

The walk away auto lock system can be cancelled temporarily by using the customized settings. See the owner's manual for more information.

Keyless Access System Operation Manual Customize

KEYLESS ACCESS SYSTEM DESCRIPTION - COMPONENTS

Power Switch

When pressing the power switch, it changes the vehicle to the OFF (LOCK), ACCESSORY, or ON mode. The power switch also includes an LF antenna.

LF (Low Frequency) Antennas

The front interior, middle interior, rear interior, front door outer handle, and rear bumper LF antennas send the signals to the remote when the remote is outside out of the vehicle.

Remote

The remote is equipped with a keyless transmitter, and all the doors can be locked and unlocked by a lock/unlock button operation, even from a remote distance from the vehicle. When the lock button or unlock button is pressed, the keyless transmitter sends the applicable switch signal to the body control module. After receiving authentication, the body control module controls the door lock/unlock actuator.

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM DESCRIPTION

Overview

Keyless Entry System

The non-selectable unlock function: When you press the LOCK button, all doors lock. When you press the UNLOCK button, all doors unlock. The doors will not lock with the remote if a door is not fully closed, or if the vehicle is in the ON mode. The selectable unlock function: When you press the LOCK button, all doors lock. When you press the UNLOCK button once, only the driver's door unlocks. The other doors will unlock when you press the button twice. (Depending on the settings in the multi-information display (MID) all the doors may unlock when you press the button the first time). The doors will not lock with the transmitter if a door is not fully closed, or if the vehicle is in the ON mode.

When the switch for the interior light is in the DOOR position, it comes on when the UNLOCK button is pressed. If a door is not opened, the light goes off and the doors will relock in about 30 seconds. If the doors are locked with the transmitter within 30 seconds, the light goes off immediately.

Door Lock Control

The door lock control function allows the body control module to detect the status of various switch signals and controls each actuator in order to lock and unlock the doors.

The system has three circuits between the door lock actuators and the body control module to improve safety of the system. One is for the driver's door lock actuator, and others are for the rear door lock actuators and passenger's side door lock actuators. The door lock actuator circuit has two fuses. When one fuse is blown, another fuse in the same circuit must be checked.

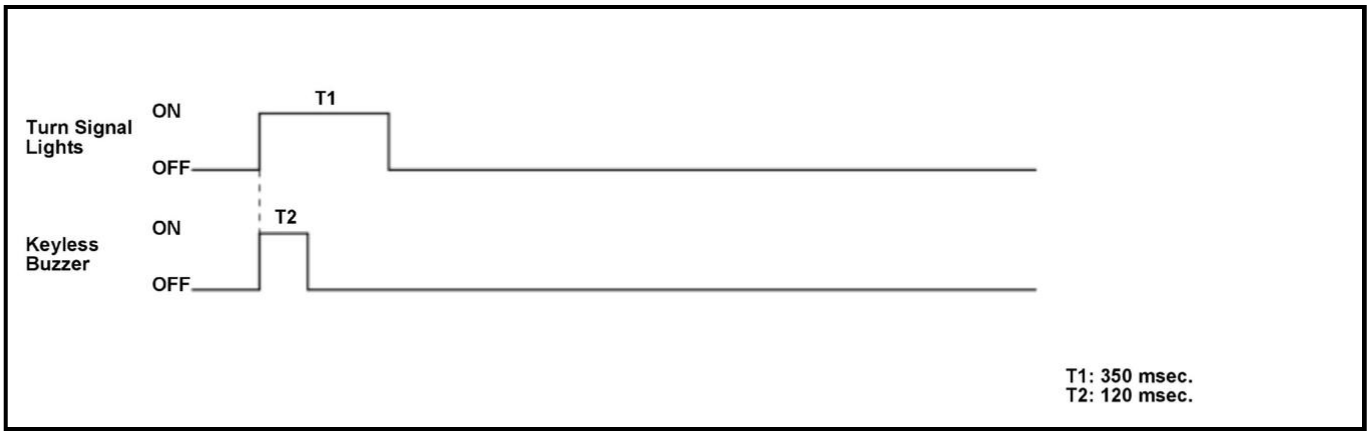
Keyless Answer Back Function

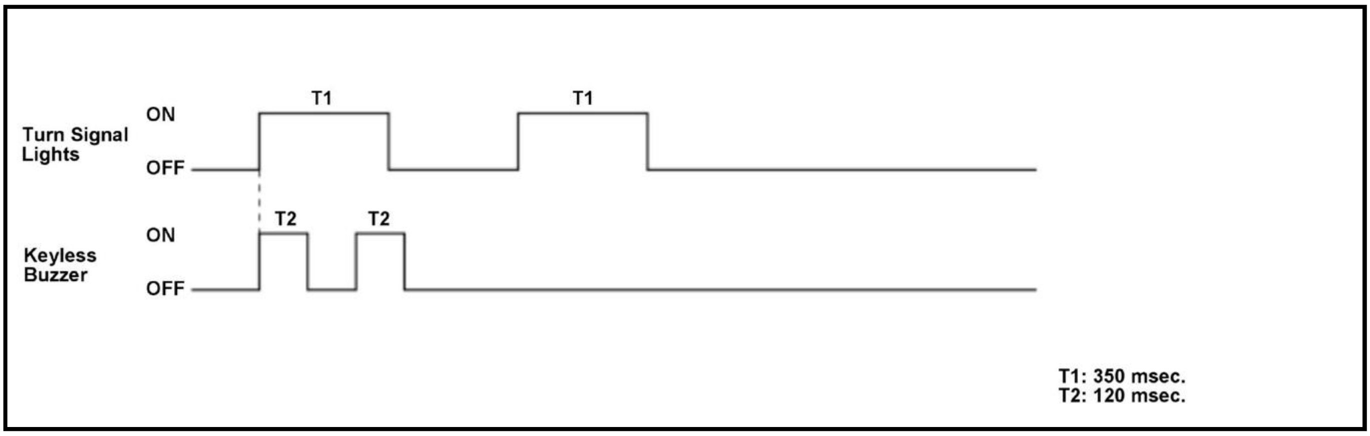
LOCK

When the body control module receives a lock signal, it sends a signal to the turn signal lights and the keyless buzzer sounds.



UNLOCK

When the body control module receives an unlock signal, it sends a signal two times to the turn signal lights and the keyless buzzer sounds.



Automatic Door Lock/Unlock Control

The automatic door lock/unlock control function allows the body control module to detect the status of B-CAN signals and various switch signals and controls each actuator in order to automatically lock/unlock the doors.

Automatic Door Lock Function:

- When the vehicle speed exceeds 9 mph (15 km/h) (Default setting)
- When the shift position/mode is out of the P position/mode

Automatic Door Unlock Function:

- When the driver's door switch is ON (door open) (Default setting)
- When the vehicle mode is changed to the OFF (LOCK) mode from the ON mode
- When the shift position/mode is moved to the P position/mode from other than the P position/mode

Customizing Function:

The locking method can be set to non-link, link to vehicle speed, link to shift position/mode, or link to ignition switch or engine start/stop switch by the customizing function. For more information about customize options, refer to the Owner's Manual.

Key Lockout Prevent Function

The body control module monitors whether or not there is the remote in the vehicle. If the remote is in the vehicle, the system will not lock the doors. If the driver manually locks and closes the doors with the remote in the vehicle, the body control module energizes the door lock actuator and unlocks the doors. Also, if the tailgate is closed when the remote is left in the vehicle with all the door closed and the driver's door lock knob at lock position, the body control module energizes the door lock actuator and unlocks the doors. In addition, when the keyless lockout prevent function operates, the answer back is performed.

Security system operating term

Start setting	• Lock the door using a mechanical key • Lock the door by using the remote • Lock the door by pressing the door outer handle lock sensor while having the remote • Operate a keyless relock
Cancellation	• Unlock the door by using the remote • Unlock the door by smart entry function • Press the power switch while having the remote

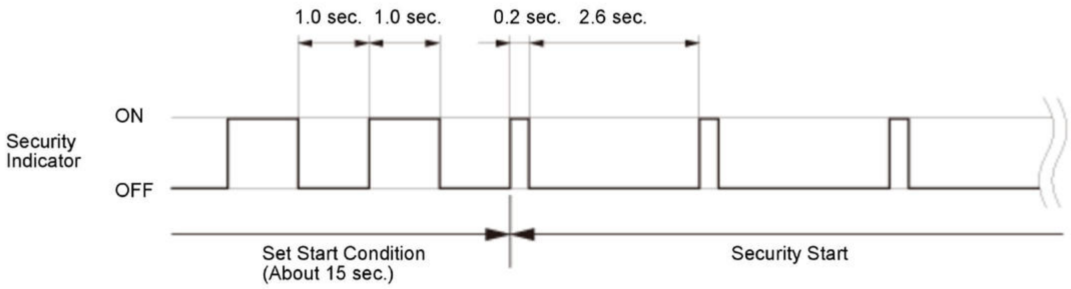
Setting conditions (related systems are normally operated)	• Door switch OFF (Door close) • Door unlock knob switch OFF (LOCK) • Tailgate latch switch *1 or full latch switch *2 OFF (Tailgate close) • Driver's door key cylinder switch OFF • Hood latch switch ON (Hood close) • Vehicle OFF (LOCK) mode • Shift P position/mode
Start the alarm	When any of the monitoring switch signal inputs are received without the signal for cancelling setting
Cancel the alarm	Compliant with the conditions for cancelling setting

*1: Without power tailgate

*2: With power tailgate

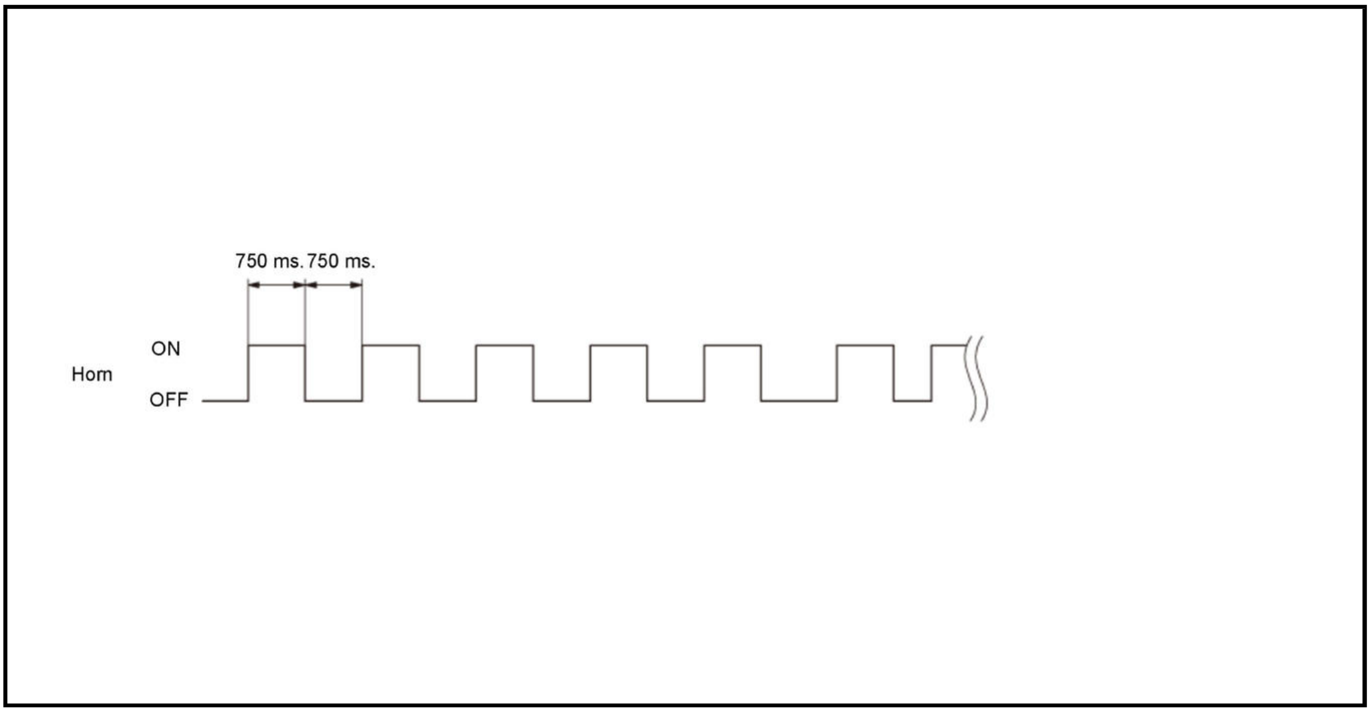
Security Setting

When the security alarm is set, the body control module sends the security set signal using the B-CAN. When the gauge control module receives a security set signal from the body control module, the security indicator flashes at a slower pace to indicate the system has armed.



Security Alarm

With the security system armed, manually opening the hood, the tailgate, moving the door lock knob to the unlock position, or shift to other than the P position/mode activates the security alarm. During activation, the horn sounds repeating this alarm (one cycle is 120 seconds). Even if you remove the 12 volt battery, the alarming state cannot be changed. The alarm starts again when reinstalling the 12 volt battery.



KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM DESCRIPTION - COMPONENTS

Door Lock Switches

The door lock switches are integrated into one unit to the power window master switch, and the front passenger's power window switch.

Door Lock Knob Switch/Door Lock Actuator/Driver's Door Key Cylinder Switch

The door lock knob switch and the door lock actuator are built into the door latch of each door. The door lock knob switch detects the lock and unlock states of the lock mechanism. The door lock actuator moves the lock mechanism back and forth between the lock and unlock position. The actuator receives lock and unlock commands from the body control module. The driver's door key cylinder switch is included in the driver's door latch assembly. In conjunction with the key cylinder, it detects the lock/unlock of the key cylinder.

Tailgate Release Actuator/Tailgate Latch Switch (Without Power Tailgate)

The body control module receives an ON signal from the tailgate outer handle switch, which then outputs a signal to the tailgate release actuator, and unlocks the tailgate latch. The tailgate latch switch is the ON/OFF switch that detects the opening/closing of the tailgate. If the tailgate release actuator is bad, the tailgate may be opened manually with the lock lever.

GENERAL INFORMATION

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING INFORMATION

General Check Before Troubleshooting

NOTE: Before troubleshooting the keyless access system, check the following items and solve any applicable issues.

- Make sure that keyless access system is not disabled by the customization.
- Make sure the fuses and relays associated with the system is OK.
- Check for poor connection at the body control module.

- Check for DTCs with the HDS; if a DTC is indicated, troubleshoot the DTC first.
- Before testing, troubleshoot the keyless access system first using SELF CHECK, and if any malfunction is found, troubleshoot it first.
- Make sure the keyless remote is not in a purse with coins, wrapped with any metallic material, placed near a cell phone or computer.
- Make sure the vehicle 12 volt battery is fully charged.
- Make sure the keyless remote batteries are not low; if they are, replace keyless remote battery.
- Make sure a different keyless remote is not being used; only use a Honda-approved keyless remote.
- Make sure the keyless remote is not attached to a key ring or key case; if it is, remove the key from it.
- Make sure aftermarket accessories are not installed; remove any aftermarket accessories.
- Make sure aftermarket accessories are not connected to the S-NET or IGN_TRX line; disconnect any aftermarket accessories from the S-NET or IGN_TRX line.
- Make sure there is no electrical interference nearby; avoid areas with electrical or radio interference.

Symptom Troubleshooting Using the Security Indicator Lighting Pattern

The immobilizer and keyless access system condition can be checked by the security indicator lighting pattern.

Normal operation:

When turning the vehicle to the ON mode and the immobilizer code is identified, the security indicator is OFF.

Immobilizer code is not identified:

When turning the vehicle to the ON mode when the immobilizer code has not been identified, the security indicator blink until the OFF (LOCK) mode is selected. Then security indicator will come on for 1 second. The state of the keyless registration and the S-NET line can be checked by doing a **SYSTEM CHECK** and **STATUS LOG** with the HDS.

Security indicator turns on:

If the security indicator turns on, **do the gauge control module self-diagnostic function procedures** . If the indicator drive circuit is OK, do the **SYSTEM CHECK** and **STATUS LOG** procedures with the HDS.

System Check and Status Log

NOTE: The HDS can be used to:

- Check the state of the keyless remote registration and the S-NET line by doing a **SYSTEM CHECK**.
- Check the number of times the keyless access control unit or the backup control unit did not permit the engine to start by checking the **STATUS LOG**.

1. **Connect the HDS to the data link connector (DLC)**

2. At SYSTEM SELECTION MENU, enter ONE-PUSH START, then select KEYLESS ACCESS CONTROL UNIT or BACKUP CONTROL UNIT.

3. At KEYLESS ACCESS CONTROL UNIT, enter KEYLESS ACCESS SYSTEM INFORMATION, then select SYSTEM CHECK 1 or SYSTEM CHECK 2.

4. At BACKUP CONTROL UNIT, enter SYSTEM INFORMATION, then select SYSTEM CHECK.

5. Do the SYSTEM CHECK. If there is a system check number, do the troubleshooting for the item indicated.

6. **Check the STATUS LOG using the HDS**.

Troubleshoot the line with the highest counts first. If all the lines are 0 (zero), the problem may not be caused by the immobilizer system or keyless access system, check for ignition or fuel problems.**NOTE:** Once repaired, clear the status log by removing the BACK UP fuse in the under-hood fuse/relay box or disconnecting the 12 volt battery.

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM TRIPPED SENSOR RECALL

The security system stores information on the last tripped sensor if the security system has been triggered. The information can be retrieved using the HDS.

1. **Connect the HDS to the data link connector (DLC)** .

2. Turn the vehicle to the ON mode. Select the following menu buttons on the HDS screen in sequence, retrieve the last tripped sensor data.

- Body Electrical
- Security
- History Data

Scroll through the data list.

- Sensors that were actuated will indicate the device that are set.
- Sensors that were not actuated will indicate NONE.

Inspect the Alarm Device circuit for:

- Misadjusted or damaged switch.
- Loose or corroded connections.
- Intermittent short to ground.

SYMPTOM TROUBLESHOOTING INDEX

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE: Before troubleshooting the keyless access system, make sure the fuses and **relays** associated with the system is OK.

Symptom	Diagnostic procedure	Also check for
Cannot select ON mode with keyless access and with the keyless remote touching the power switch	**Symptom troubleshooting**	• Poor connections at the body control module • Keyless remote • Body control module • Power switch • Harness/connections
Cannot select ON mode with keyless access, but can select ON mode with the keyless remote touching the power switch	**Symptom troubleshooting**	• Body control module • LF antenna • Keyless remote • Low or weak keyless remote battery • Harness/connections
Cannot select ON mode with the keyless remote touching the power	Check the body control module	• Body control module is not registered • Body control module

Symptom	Diagnostic procedure	Also check for
switch, but can select ON mode with keyless access		- IGN_TRX line open/short - Not registered - Harness/connections
The mode changes between ACCESSORY and ON, but it does not change to OFF (LOCK)	- Check the body control module - Check the SBW shifter control module	- Body control module - ATP-P line open - SBW shifter control module
The mode changes between ACCESSORY and ON, but it is difficult to change to OFF (LOCK)	- Check the body control module - Check the gauge control module	- Gauge control module - Body control module - PCM - B-CAN communication line open/short - F-CAN communication line open/short - Speed signal line open
Power switch does not work	Check for DTCs. If any DTC is indicated, go to the DTC troubleshooting	- ACC relay circuit - Body control module - Power switch - SS1(+) line short - SS2(-) line short - Harness
Engine does not crank (power supply is normal)	- Check the brake pedal position switch - Check the body control module	- Body control module - STS line open/short - Brake pedal position switch - STOP_SW line open/short
The engine starts, but stalls immediately	**Symptom troubleshooting**	- No power to PCM - No power to body control module - Body control module - Gauge control module - Harness/connections

Symptom	Diagnostic procedure	Also check for
Keyless access indicator does not go off or does not come on	**Symptom troubleshooting**	- Gauge control module - Body control module - Harness/connections
Security indicator blinks	**Symptom troubleshooting**	- Gauge control module - Body control module - PCM - Harness/connections

Symptom	Diagnostic procedure	Also check for
All the doors will not lock and unlock	Symptom troubleshooting	- Body control module - LF antenna - Driver's door lock knob switch - Door outer handle touch sensors - Door lock actuators - Keyless remote - Low or weak keyless remote battery - Not registered
The doors will not unlock or lock with the keyless remote, but will unlock or lock with the door outer handles	Symptom troubleshooting	- Keyless remote battery dead - Keyless remote - Body control module - Harness/connections - B-CAN communication line
The doors will not unlock or lock with the door outer handle touch sensors, but will unlock or lock with the keyless remote	Symptom troubleshooting	- Door outer handle touch sensors - Body control module - Keyless remote - Not registered - Harness/connections

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM SYMPTOM TROUBLESHOOTING INDEX

NOTE:

- If the door lock system and the keyless operation do not work, troubleshoot the door locks first. The system does not function when turn the vehicle to the ON mode.
- Before troubleshooting, make sure the fuses and relays associated with the system is OK.

Symptom	Check Items	Also Check for
All the doors will not lock or unlock with driver's door key cylinder or door lock switch or keyless transmitter/remote	- Poor ground (G351, G401) - Blown fuses associated with the system - Body control module input test - Power window master switch input test - Remote test	B
Driver's door will not lock or unlock	- Poor ground (G401) - Blown fuses associated with the system - Door switch test (check the door switch ON/OFF information with the HDS) - Body control module input test	B

Symptom	Check Items	Also Check for
	- **Power window master switch input test** - **Door lock actuator test**	
Front passenger's door will not lock or unlock	- Poor ground (G401) - Blown fuses associated with the system - **Body control module input test** - Door switch test (check the door switch ON/OFF information with the HDS) - **Door lock actuator test**	B
Left rear door will not lock or unlock	- Poor ground (G501) - Blown fuses associated with the system - **Body control module input test** - Door switch test (check the door switch ON/OFF information with the HDS) - **Door lock actuator test**	B
Right rear doors will not lock or unlock	- Poor ground (G502) - Blown fuses associated with the system - **Body control module input test** - Door switch test (check the door switch ON/OFF information with the HDS) - **Door lock actuator test**	B
Front passenger's doors will not unlock with the remote or key cylinder switch, but will unlock with the inside door unlock switch	**Driver's door lock knob switch test** (check for door lock knob switch ON/OFF information with the HDS)	B
Doors automatically relock 30 seconds after being unlocked with the remote even though a door has been opened	**Symptom troubleshooting**	B
Auto door unlock does not work	**Symptom troubleshooting**	B
Security alarm system will not arm	**Symptom troubleshooting**	B
The security system sounds randomly while the doors are locked	**Tripped sensor recall**	B

SYMPTOM TROUBLESHOOTING

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - ALL THE DOORS WILL NOT LOCK AND UNLOCK

1. Door lock actuator operation check 1

-1. Put out all the keyless remotes from inside the vehicle, and close all doors and tailgate.

-2. Press each LOCK and UNLOCK buttons of the keyless remote, at least ten times.

Do the door lock actuators work normally?

YES

Go to step 2.

NO

Go to step 3.

2. Door lock actuator operation check 2

   -1. Lock and unlock the doors with touching the door outer handle.

   Do the door lock actuators work normally?

   YES

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

   NO

   Go to symptom trouble shooting "The doors will not unlock or lock with the door outer handle touch sensors, but will unlock or lock with the keyless remote".

3. Determine possible failure area (keyless remote, others)

   -1. Press the LOCK and the UNLOCK buttons of the keyless remote, and check if the LED on the keyless remote comes on.

   Does the LED come on?

   YES

   Go to step 4.

   NO

   Replace the keyless remote battery and recheck the system. If the symptom does not go away, replace the keyless remote .

4. Door lock actuator operation check 2

   -1. Lock and unlock the doors with touching the door outer handle.

   Do the door lock actuators work normally?

   YES

   Register the keyless remote, and recheck. If the symptom does not go away, **replace the keyless remote** .

   NO

   Go to step 5.

5. Door lock actuator operation check 3

   -1. Lock and unlock the doors with the driver's door touch sensors.

Do the door lock actuators work normally?

YES

Go to step 6.

NO

Check the B-CAN system DTCs. If not, check the door lock system.

6. Keyless access system check

   -1. Do the keyless access remote check using the all keyless remotes .

   Are the all keyless remotes OK?

   YES

   Do the SYSTEM CHECK 1 and SYSTEM CHECK 2 with the HDS. If the result is indicated, troubleshoot the items based on the SYSTEM CHECK table.

   NO

   Replace the keyless remote and recheck.

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - CANNOT SELECT ON MODE WITH KEYLESS ACCESS AND WITH THE KEYLESS REMOTE TOUCHING THE POWER SWITCH

1. Keyless access system check 1

   -1. Do this procedure ten times: Turn the vehicle to the ON mode.

   Does the system change to ON mode?

   YES

   Intermittent failure, the system is OK at this time. Check for loose or poor connection.

   NO

   Go to step 2.

2. Keyless access system check 2

   -1. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -2. Turn the vehicle to the ON mode.

   Does the system change to ON mode?

   YES

   Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access, but can select ON mode with the keyless remote touching the power switch".

   NO

   Go to step 3.

3. Keyless access system check 3

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   Does the system communicate with the HDS?

   YES

   Go to step 4.

   NO

   Go to step 10.

4. Keyless access system check 4

   -1. Reboot the HDS.

   -2. Select model on the HDS screen.

   -3. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the power switch for at least 2 minutes. This selects the forced ON mode.

   Does the system change to forced ON mode?

   YES

   Go to step 5.

   NO

   Go to step 15.

5. PCU DTC check

   -1. Check for PCU DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Troubleshoot the PCU DTCs.

   NO

   Go to step 6.

6. Keyless access DTC check

   -1. Check for keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the keyless access control unit DTCs.

NO

Go to step 7.

7. Backup DTC check

-1. Check for backup control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the backup control unit DTCs.

NO

Go to step 8.

8. Keyless access system check 5

-1. **Do the keyless access remote check using the all keyless remotes** .

Are the all keyless remotes OK?

YES

Go to step 9.

NO

Replace the keyless remote and recheck.

9. Keyless access system check 6

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove all the keyless remotes from inside the vehicle. Place the keyless remotes more than 1.5 m (5.0 ft) away from the vehicle.

-3. Reboot the HDS without pressing the power switch.

-4. Do the registration of the body control module according to the instructions on the HDS screen.

-5. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, then select REPLACE PCU/BACKUP CONTROL/KEYLESS ACCESS CONTROL UNIT.

-6. Take the keyless remote into the vehicle, and clear the PCU DTCs with the HDS.

-7. Do this procedure ten times: Turn the vehicle to the ON mode.

Does the system change to ON mode?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connection.

NO

Replace the body control module .

10. L-line check

-1. **Do the DLC circuit troubleshooting** .

Is L-line OK?

YES

Go to step 11.

NO

Repair an L-line wire circuit.

11. Power switch operation check

-1. **Do the power switch test** .

Is the power switch OK?

YES

Go to step 12.

NO

Replace the power switch .

12. Open wire check (SS1(+), SS2(-) lines)

-1. Disconnect the following connectors.

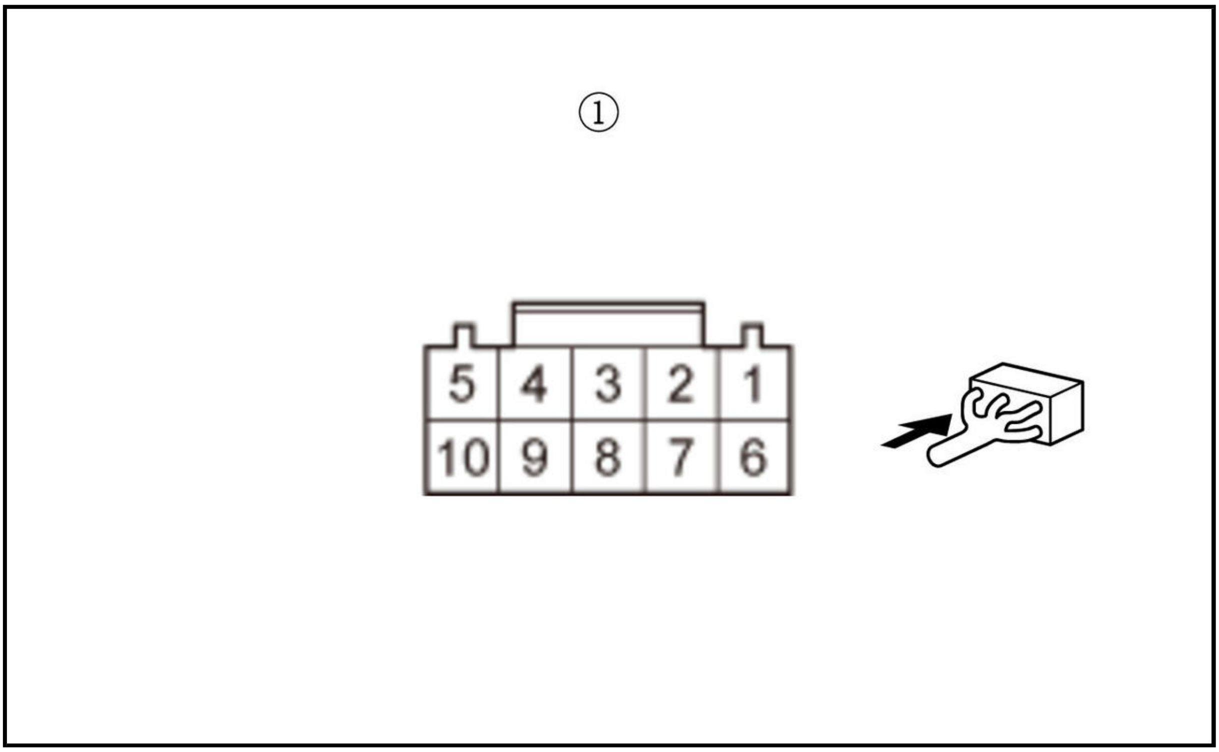
Power switch 10P connector Body control module connector G (32P)

-2. Measure the resistance between test points 1 and 2 respectively.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected

Test point 1	Power switch 10P connector (female terminals) No. 6: ①
Test point 2	**Body control module connector G (32P) No. 18**

Test point 1	Power switch 10P connector (female terminals) No. 10: ①
Test point 2	**Body control module connector G (32P) No. 9**



Is there 1.0 Ω or less?

YES

The SS1(+) and SS2(-) wires are OK. Go to step 13.

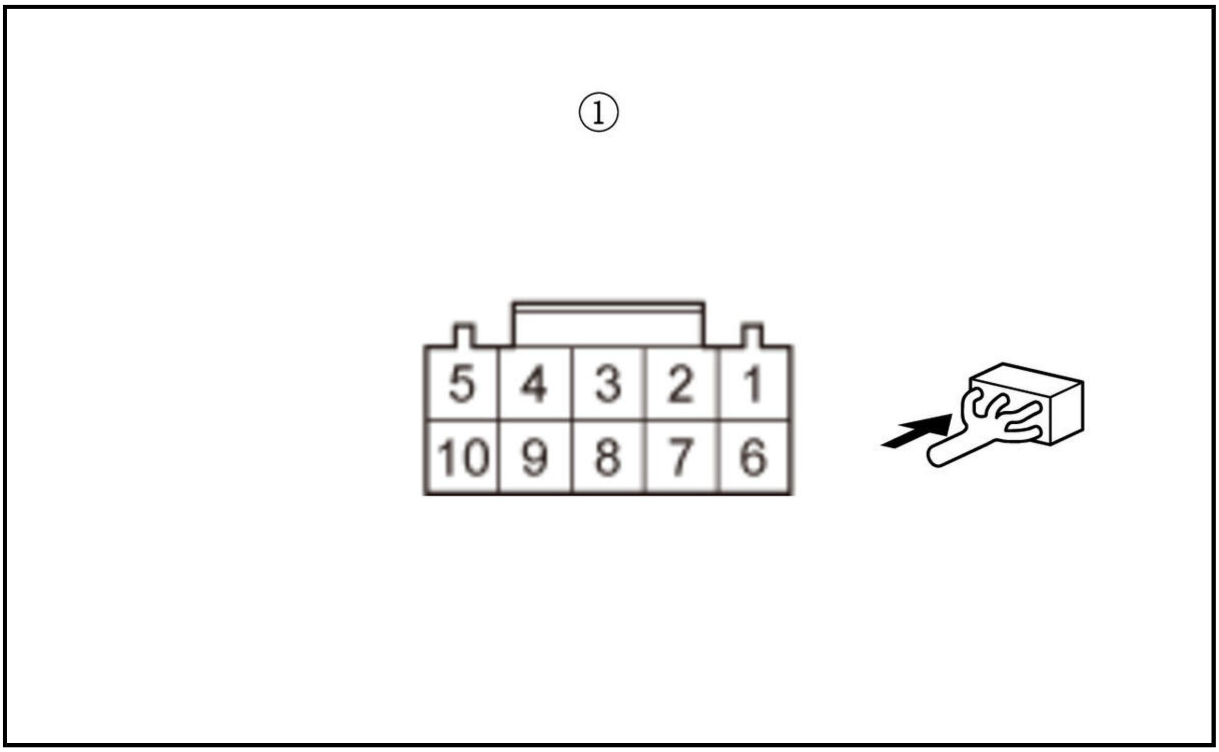
NO

Repair an open or high resistance in the wire.

13. Open wire check (+B_SMART line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Power switch 10P connector (female terminals) No. 5: ①
Test point 2	Body ground



Is there battery voltage?

YES

The +B_SMART wire is OK. Go to step 14.

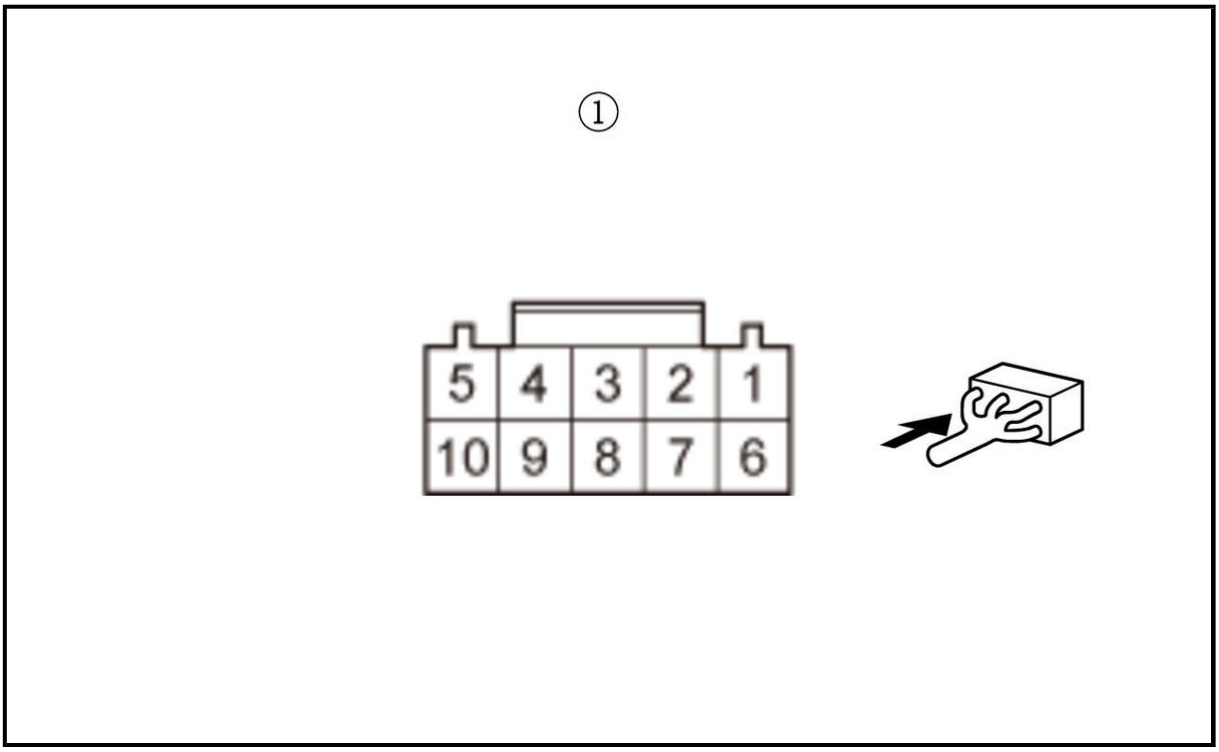
NO

Repair an open or high resistance in the wire.

14. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Power switch 10P connector (female terminals) No. 1: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 16.

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

15. PCU DTC check

-1. Check for PCU DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the PCU DTCs.

NO

Go to step 16.

16. Open wire check (+B_BACK_UP, +B_SMART lines)

-1. Disconnect the following connectors.

Body control module connector B (36P) Body control module connector C (28P)

-2. Measure the voltage between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected

	Body control module connector B (36P): disconnected Body control module connector C (28P): disconnected
Test point 1	**Body control module connector B (36P) No. 16**
Test point 2	Body ground

Test point 1	**Body control module connector C (28P) No. 27**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACK_UP, and +B_SMART wires are OK. Go to step 17.

NO

Repair an open or high resistance in the wire.

17. Open wire check (GND line)

-1. Disconnect the following connector.

Body control module connector A (14P)

-2. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector A (14P): disconnected Body control module connector B (36P): disconnected Body control module connector C (28P): disconnected
Test point 1	**Body control module connector A (14P) No. 2**
Test point 2	Body ground

Test point 1	**Body control module connector A (14P) No. 8**
Test point 2	Body ground

Is there 1.0 Ω or less?

YES

The GND wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - CANNOT SELECT ON MODE WITH KEYLESS ACCESS, BUT CAN SELECT ON MODE WITH THE KEYLESS REMOTE TOUCHING THE POWER SWITCH

1. Keyless access system check 1

-1. Press the LOCK and the UNLOCK buttons of the keyless remote, and check if the LED on the keyless remote comes on.

Does the LED come on?

YES

Go to step 2.

NO

Replace the keyless remote battery and recheck the system. If the symptom does not go away, replace the keyless remote .

2. Keyless access system check 2

   -1. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -2. Turn the vehicle to the ON mode.

   -3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   Does the system communicate with the HDS?

   YES

   Go to step 3.

   NO

   Do the input test for the body control module .

3. PCU DTC check

   -1. Check for PCU DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Troubleshoot the PCU DTCs.

   NO

   Go to step 4.

4. Keyless access DTC check

   -1. Check for keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Troubleshoot the keyless access control unit DTCs.

NO

Go to step 5.

5. Backup DTC check

-1. Check for backup control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the backup control unit DTCs.

NO

Go to step 6.

6. Keyless access system check 3

-1. Select HISTORY DATA from the KEYLESS ACCESS CONTROL UNIT mode menu with the HDS.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Select HISTORY CLEAR, and back to TEST MODE MENU.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

-5. Turn the vehicle to the ON mode.

-6. Select HISTORY DATA from the KEYLESS ACCESS CONTROL UNIT mode menu with the HDS.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

History Data

ENGINE START/STOP SWITCH 1 (+)	ON
ENGINE START/STOP SWITCH 2 (-)	ON

Is all the information ON?

YES

Go to step 8.

NO

Go to step 7.

7. Open wire check (SS1(+), SS2(-) lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

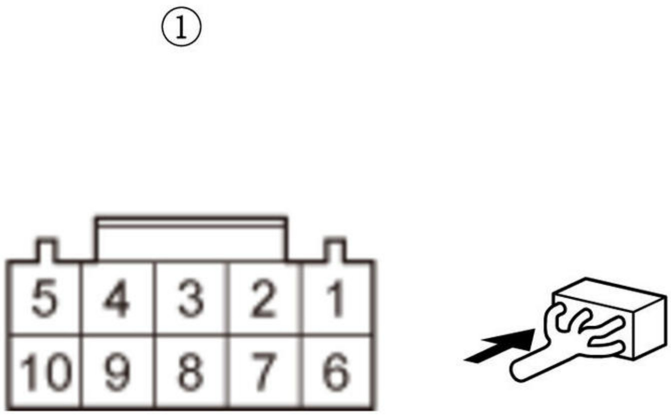
-2. Disconnect the following connectors.

Power switch 10P connector Body control module connector G (32P)

-3. Measure the resistance between test points 1 and 2 respectively.

Test condition	Vehicle OFF (LOCK) mode Power switch 10P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 18**
Test point 2	Power switch 10P connector (female terminals) No. 6: ①

Test point 1	**Body control module connector G (32P) No. 9**
Test point 2	Power switch 10P connector (female terminals) No. 10: ①



Is there 1.0 Ω or less?

YES

The SS1(+) and SS2(-) wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

8. Keyless access system check 4

-1. **Do the keyless access remote check using the all keyless remotes** .

Are the all keyless remotes OK?

YES

Replace the body control module .

NO

Replace the keyless remote and recheck.

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - KEYLESS ACCESS INDICATOR DOES NOT GO OFF OR DOES NOT COME ON

1. Keyless access system check 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode.

-3. Check the keyless access indicator.

Does the keyless access indicator come on for 2 seconds?

YES

Go to step 2.

NO

Do the gauge control module self-diagnostic function test . If the indicator does not come on, replace the gauge control module .

2. Keyless access system check 2

-1. Check the keyless access indicator.

Does the indicator blink once, then stay off?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Go to step 3.

3. PCU, backup, and keyless access DTC check

-1. Check for DTCs in the PCU, backup control unit, and keyless access control unit with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

DTC Description	DTC
B	B

Are there any DTCs?

YES

Go to the indicated DTC troubleshooting.

NO

Replace the gauge control module .

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - SECURITY INDICATOR BLINKS

1. Keyless access system check 1

-1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with HDS, and enter KEYLESS ACCESS SYSTEM INFORMATION.

One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK 1

One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK 2

Do the SYSTEM CHECK 1 and 2 with the HDS.

Is N-1 OK indicated?

YES

Go to step 2.

NO

Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 1 and 2.

2. Keyless access system check 2

-1. With driver's power window open and all the doors closed, turn the vehicle to the OFF (LOCK) mode.

-2. Remove all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

-3. Press the power switch. The MID should request the keyless remote to touch the power switch. The LED on the power switch will flash for up to 30 seconds.

-4. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you. The LED on the power switch will turn solid when detected.

-5. Turn the vehicle to the ON mode.

-6. Select BACKUP CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.

One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK

Do the SYSTEM CHECK with the HDS.

Is N-1 OK indicated?

YES

Go to step 3.

NO

Troubleshoot the keyless access system according to the result of the SYSTEM CHECK.

3. Gauge control module check

-1. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.

Self diagnostic function - GAUGES

Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

Does the security indicator blinking?

YES

Go to the PGM-FI system troubleshooting.

NO

Replace the gauge control module .

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - THE DOORS WILL NOT UNLOCK OR LOCK WITH THE DOOR OUTER HANDLE TOUCH SENSORS, BUT WILL UNLOCK OR LOCK WITH THE KEYLESS REMOTE

NOTE: Before troubleshooting, make sure the BACK UP fuse in the under-hood fuse/relay box is OK.

1. Keyless access system check 1

   -1. Turn the vehicle to the ON mode.

   Does the system change to ON mode?

   YES

   Go to step 2.

   NO

   Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access and with the keyless remote touching the power switch".

2. Keyless access DTC check

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   Check for keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Troubleshoot the keyless access control unit DTCs.

   NO

   Go to step 3.

3. Keyless access system check 2

-1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Select HISTORY CLEAR, and back to TEST MODE menu.

-3. Touch the each door outer handle touch sensors, then check the HISTORY DATA.

History Data

DRIVER DOOR UNLOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK
FRONT PASSENGER DOOR UNLOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Go to step 4.

NO

Go to step 6.

4. Keyless access system check 3

-1. Touch the each door outer handle lock sensors, then check the HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

History Data

DRIVER DOOR LOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK
FRONT PASSENGER DOOR LOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Go to step 5.

NO

Go to step 8.

5. Door lock actuator operation check

-1. Turn the vehicle to the OFF (LOCK) mode, and close all doors.

-2. Lock and unlock the doors with the driver's door touch sensors, and lock and unlock the doors with the front passenger's door touch sensors.

Do the door lock actuators work normally?

YES

Do the input test for the body control module , and do all power, ground, and communication input tests. If the body control module input tests prove OK, **replace the body control module** .

NO

Check the B-CAN system DTCs. If not, check the door lock system.

6. Door outer handle power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

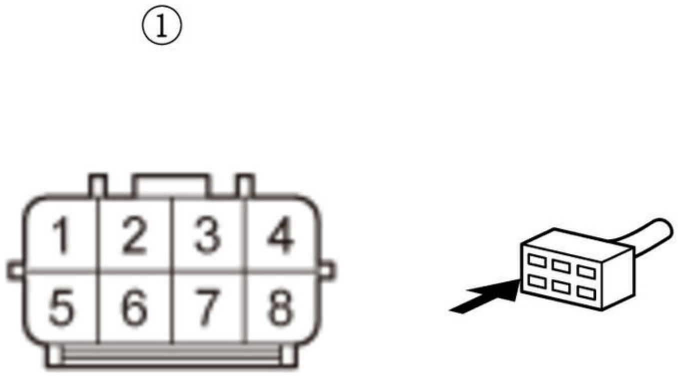
-2. Disconnect the following connectors.

Each door outer handle 8P connector

-3. Measure the voltage between test points 1 and 2 respectively.

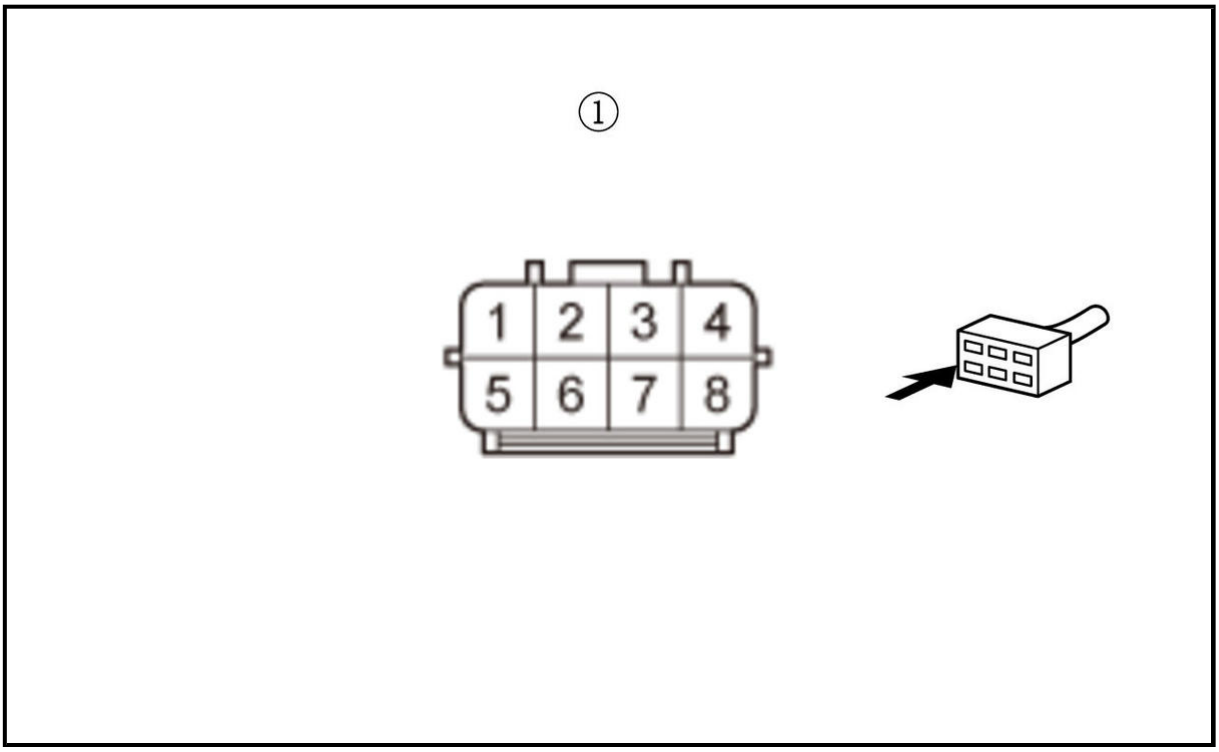
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 8: ①



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 8: ①



Is there battery voltage?

YES

Go to step 7.

NO

Go to step 10.

7. Determine possible failure area (door outer handle, others)

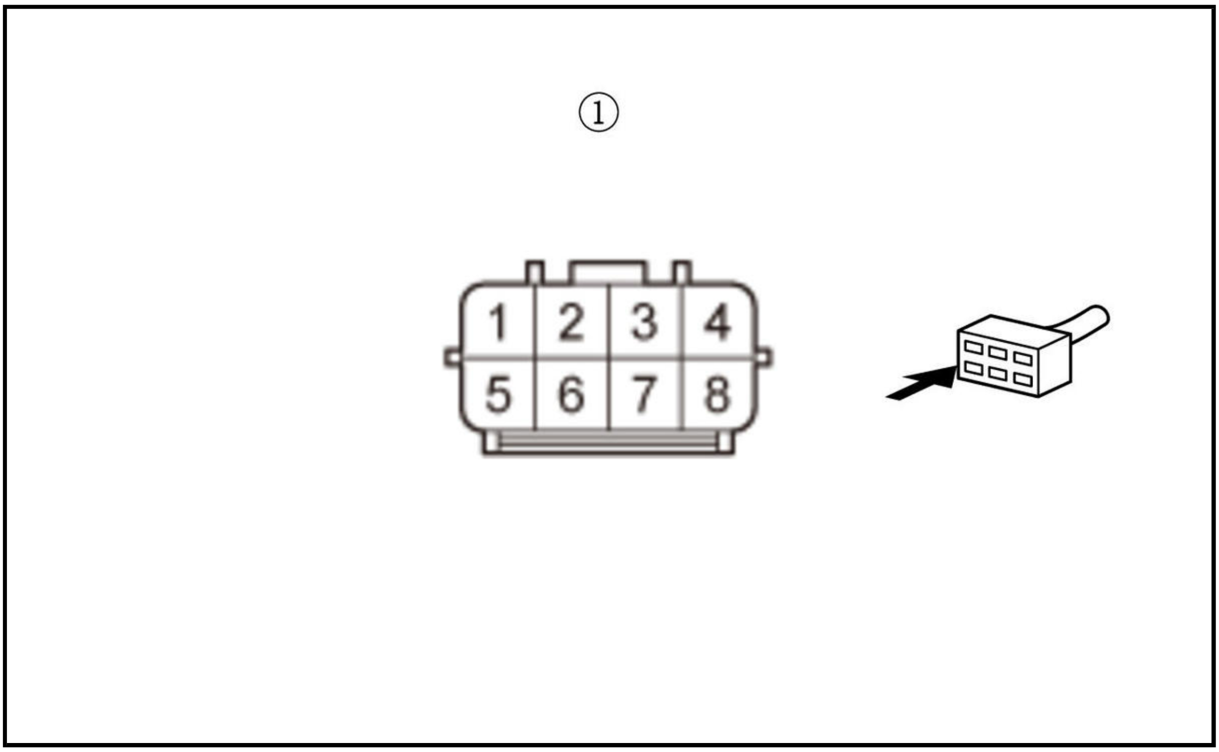
-1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA, then enter the HISTORY CLEAR.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Connect terminals A and B with a jumper wire.

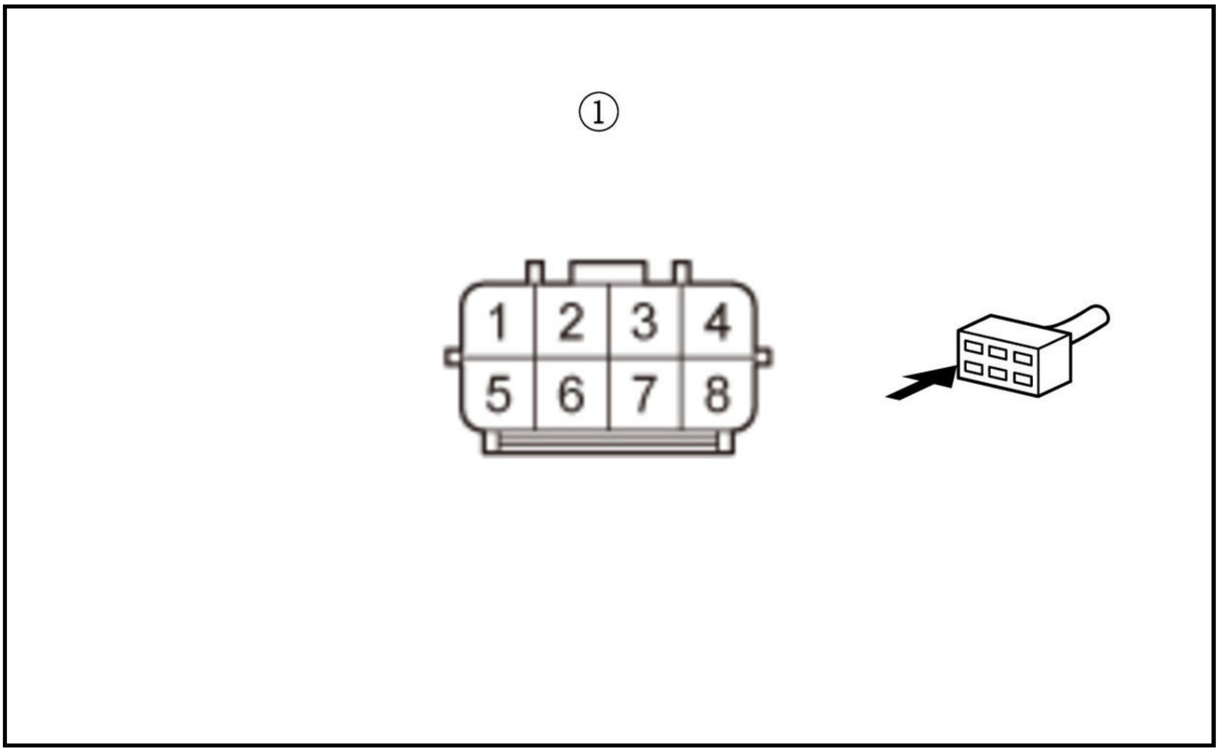
Driver's door

Terminals A	Driver's door outer handle 8P connector (female terminals) No. 7: ①
Terminals B	Body ground



Front passenger's door

Terminals A	Front passenger's door outer handle 8P connector (female terminals) No. 7: ①
Terminals B	Body ground



-3. Go back to TEST MODE menu, and recheck the HISTORY DATA.

History Data

DRIVER DOOR LOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK
FRONT PASSENGER DOOR LOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Replace the faulty door outer handle .

NO

Go to step 14.

8. Door outer handle power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

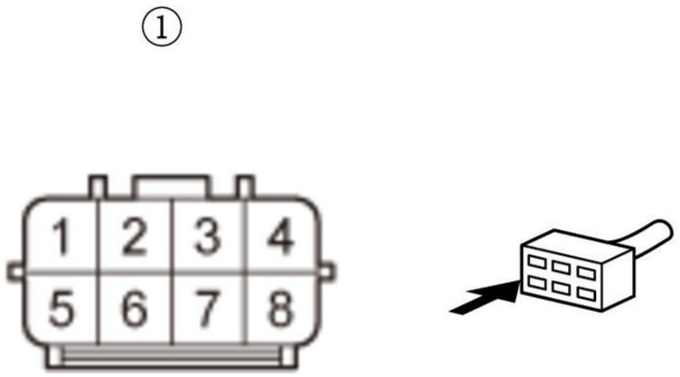
-2. Disconnect the following connectors.

Each door outer handle 8P connector

-3. Measure the voltage between test points 1 and 2 respectively.

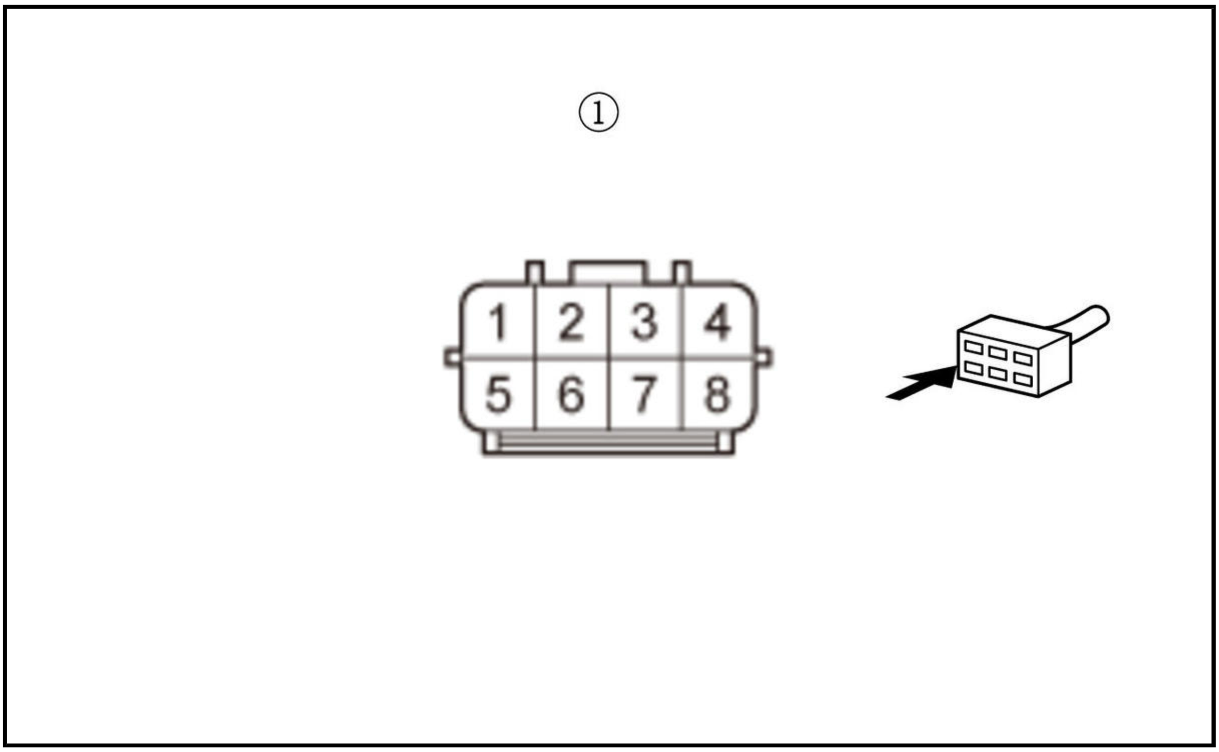
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 8: ①



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 8: ①



Is there battery voltage?

YES

Go to step 9.

NO

Go to step 10.

9. Determine possible failure area (door outer handle, others)

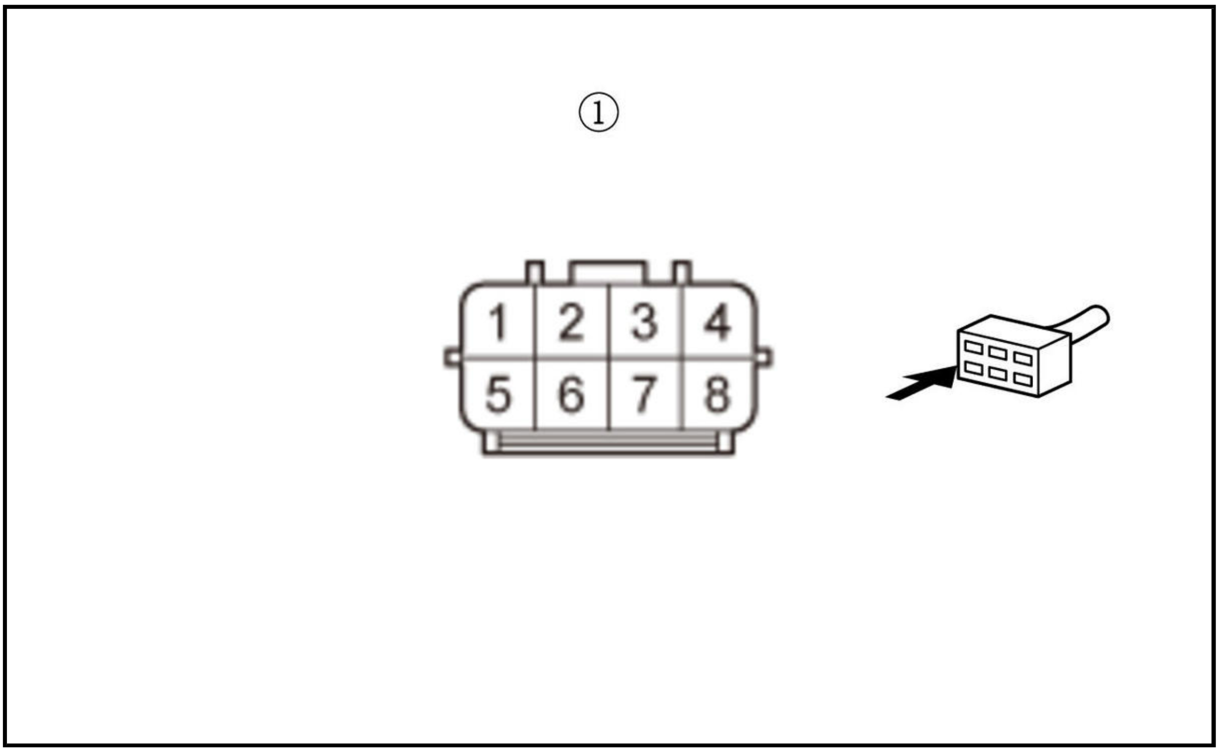
-1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA, then enter the HISTORY CLEAR.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Connect terminals A and B with a jumper wire.

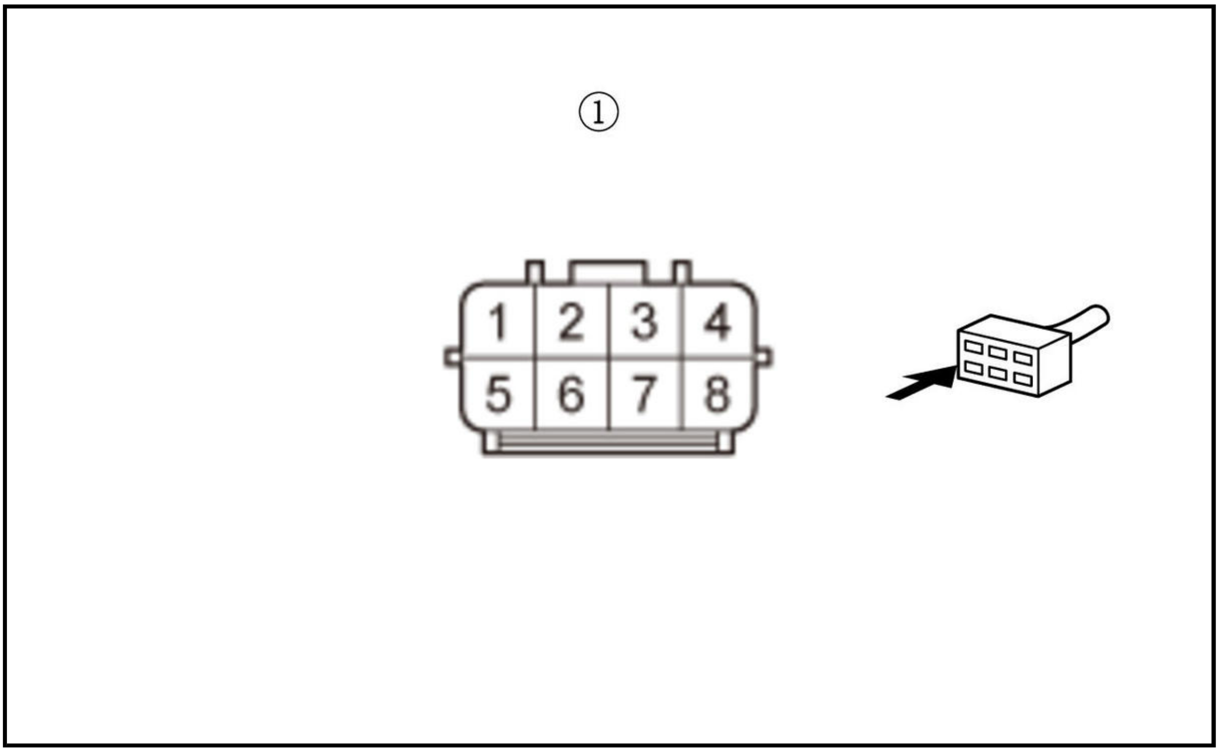
Driver's door

Terminals A	Driver's door outer handle 8P connector (female terminals) No. 7: ①
Terminals B	Body ground



Front passenger's door

Terminals A	Front passenger's door outer handle 8P connector (female terminals) No. 7: ①
Terminals B	Body ground



-3. Check the HISTORY DATA with the HDS.

History Data

DRIVER DOOR LOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK
FRONT PASSENGER DOOR LOCK SWITCH (OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Replace the faulty door outer handle .

NO

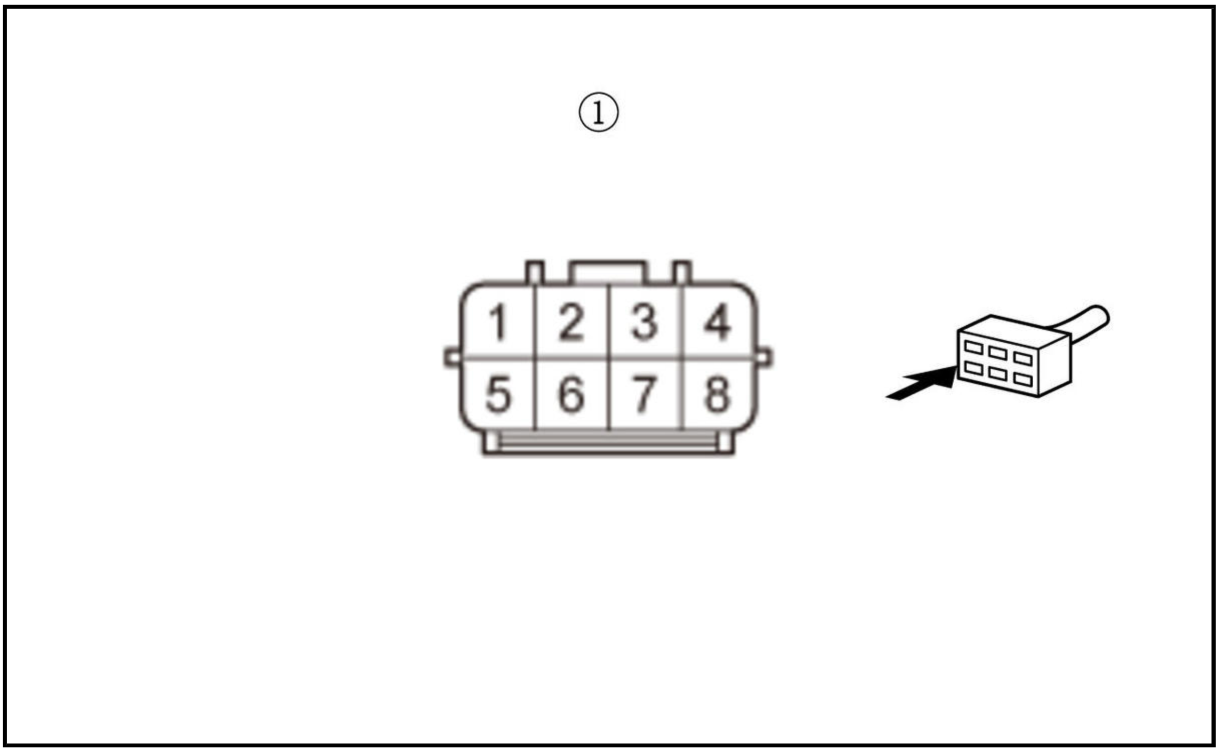
Go to step 16.

10. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2 individually.

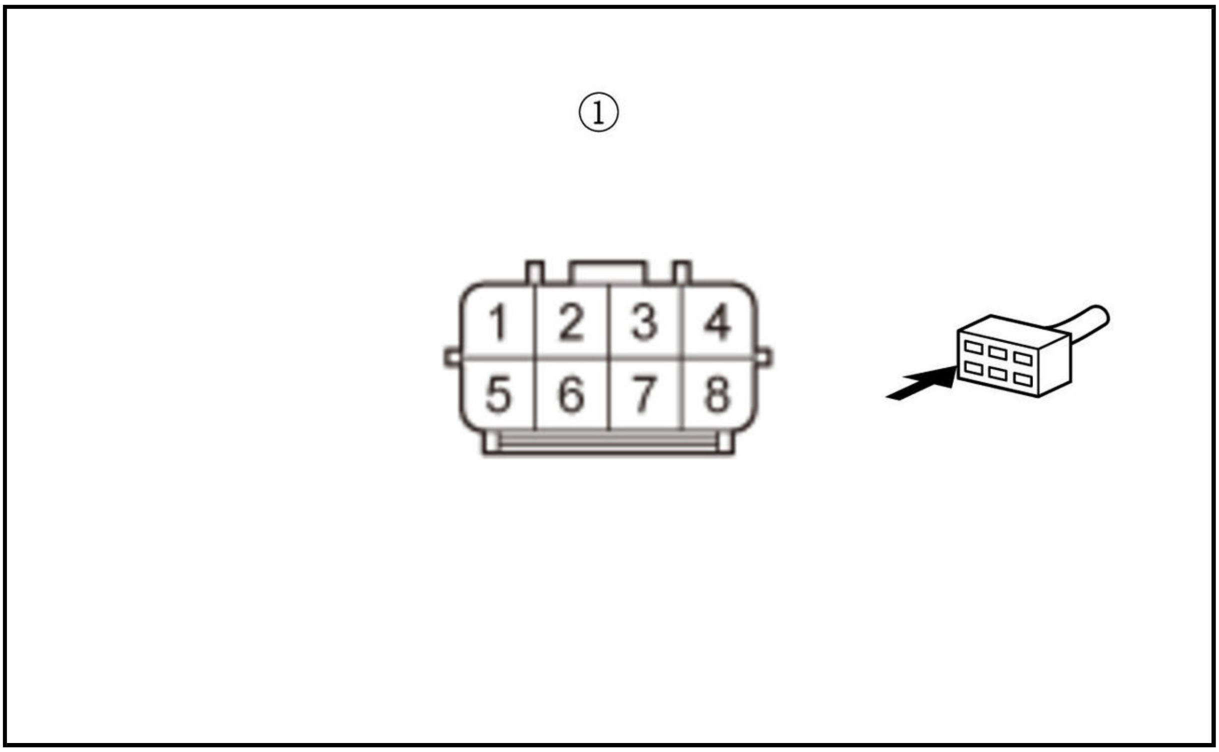
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 8: ①
Test point 2	Body ground



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wires are OK. Go to step 11.

NO

Repair an open or high resistance in the ground wire or poor ground (G401, G402).

11. Open wire check (VOUT_FR_DR, VOUT_FR_AS lines)

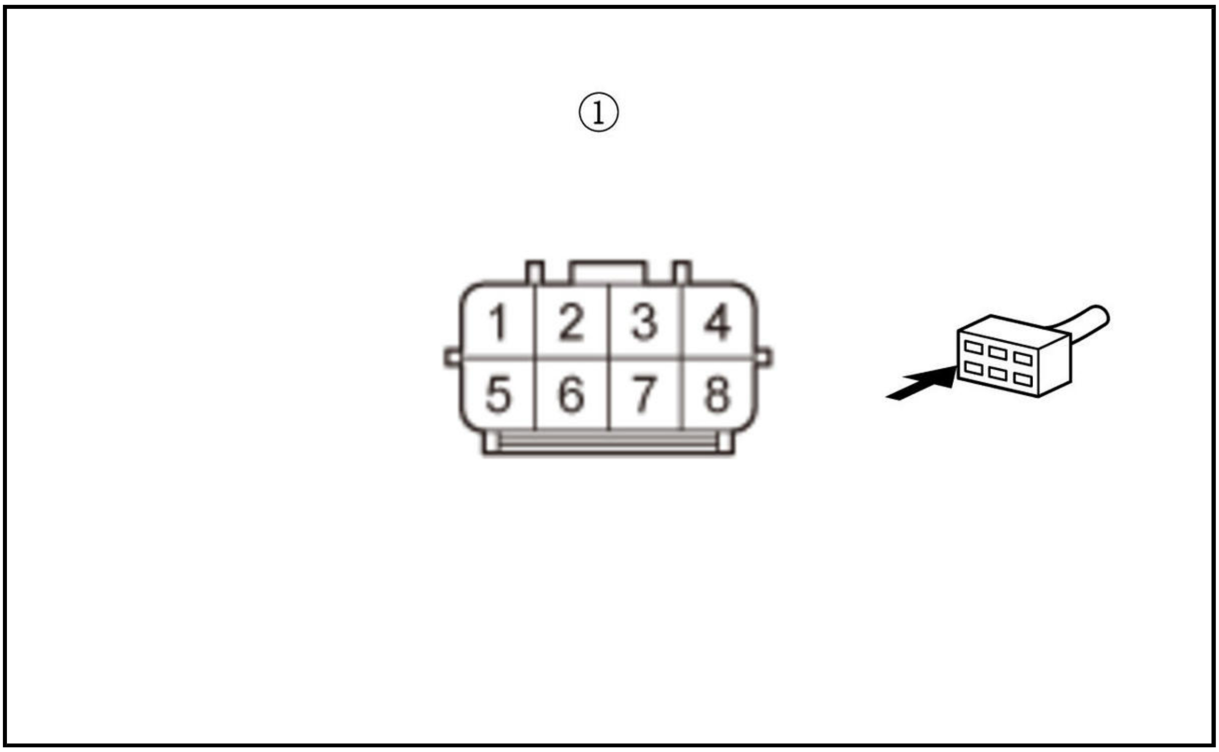
-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Measure the resistance between test points 1 and 2 respectively.

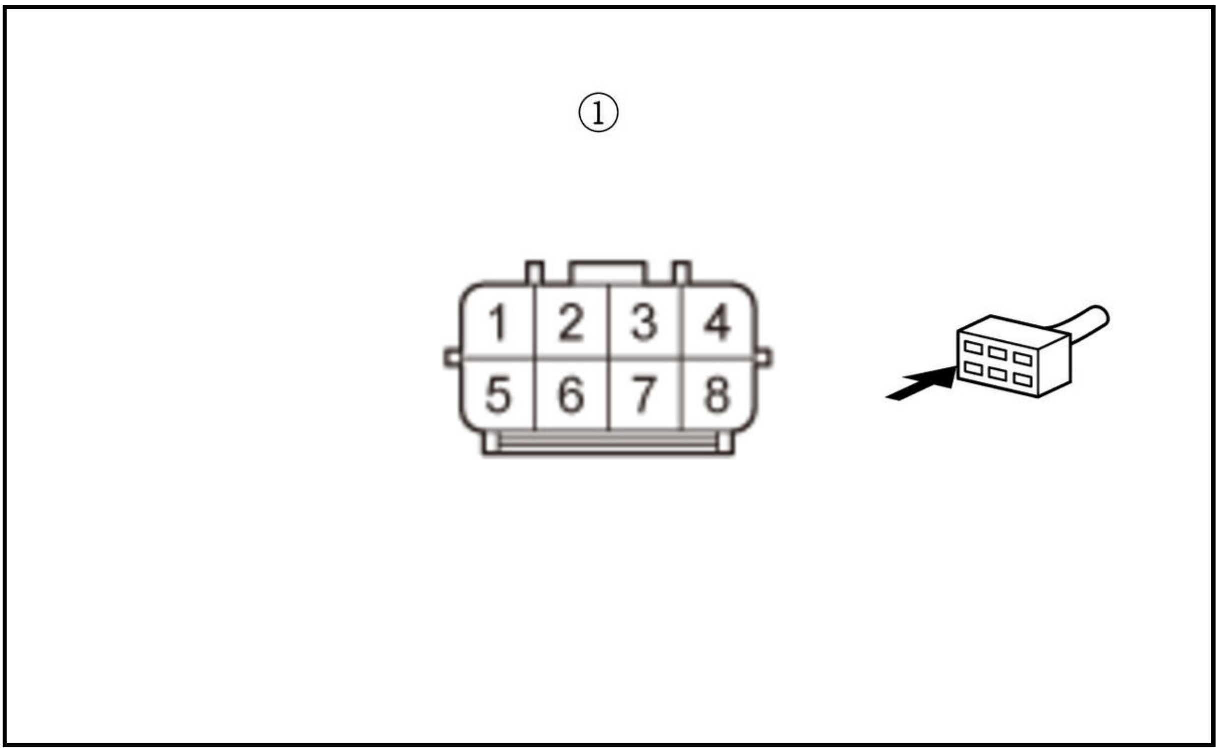
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 31**
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 4: ①



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 30**
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The VOUT_FR_DR and VOUT_FR_AS wires are not open. Go to step 12.

NO

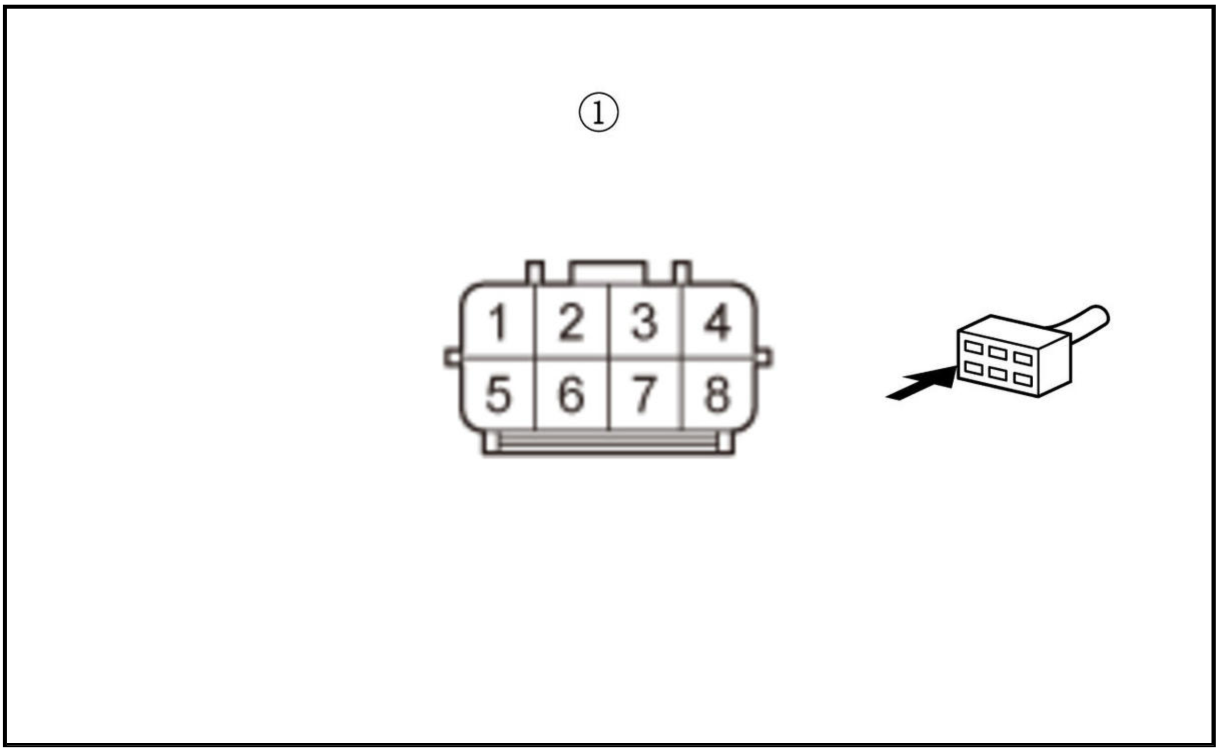
Repair an open or high resistance in the wire.

12. Shorted wire check (VOUT_FR_DR, VOUT_FR_AS lines)

-1. Measure the resistance between test points 1 and 2 individually.

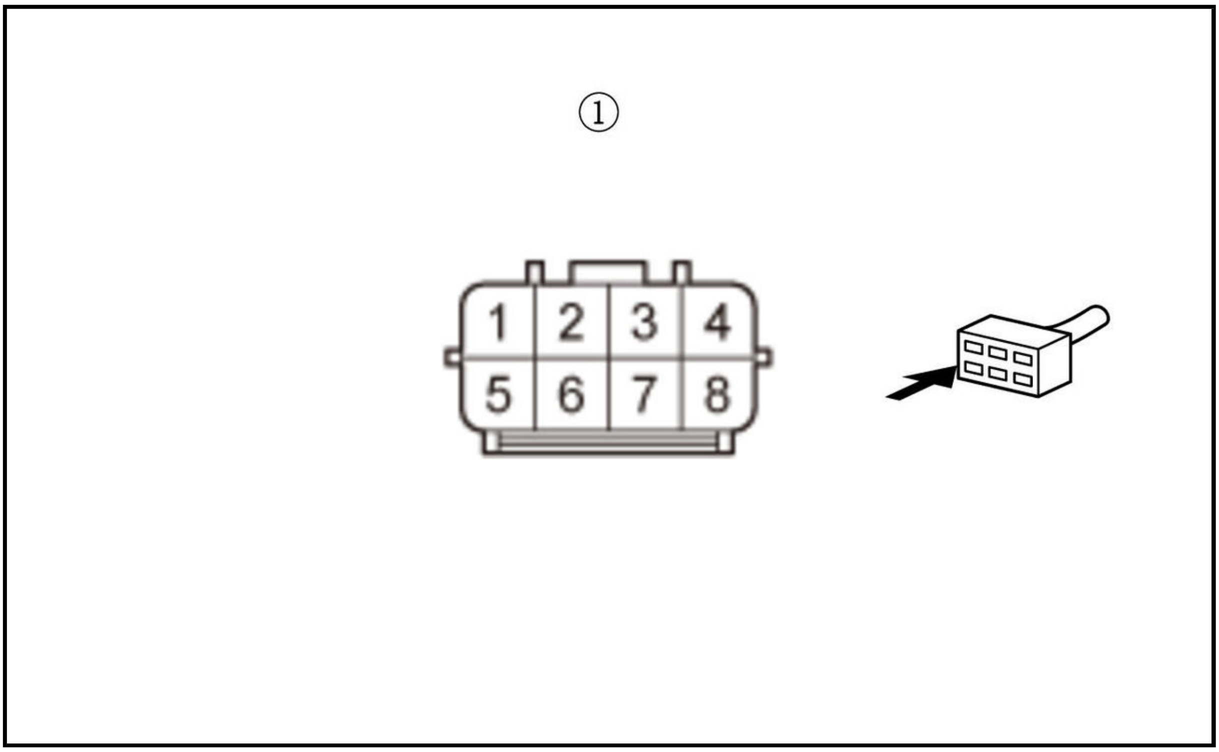
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there 1.0 MΩ or more?

YES

The VOUT_FR_DR and VOUT_FR_AS wires are OK. Go to step 13.

NO

Repair a short to ground in the wire.

13. Open wire check (+B_BACK_UP line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Each door outer handle 8P connectors: disconnected Body control module connector C (28P): disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector C (28P) No. 27**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACK_UP wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

14. Open wire check (TS_FR_DR, TS_FR_AS lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

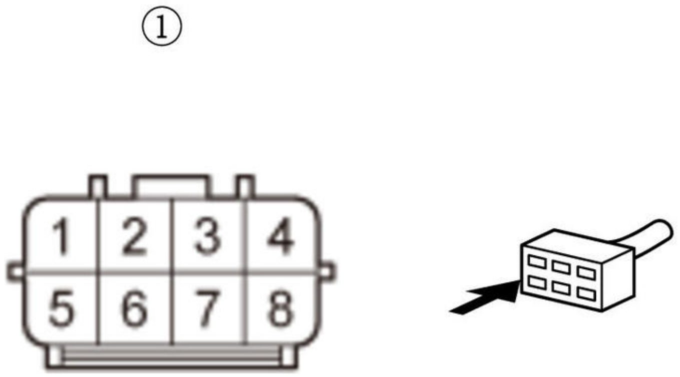
-2. Disconnect the following connector.

Body control module connector G (32P)

-3. Measure the resistance between test points 1 and 2 respectively.

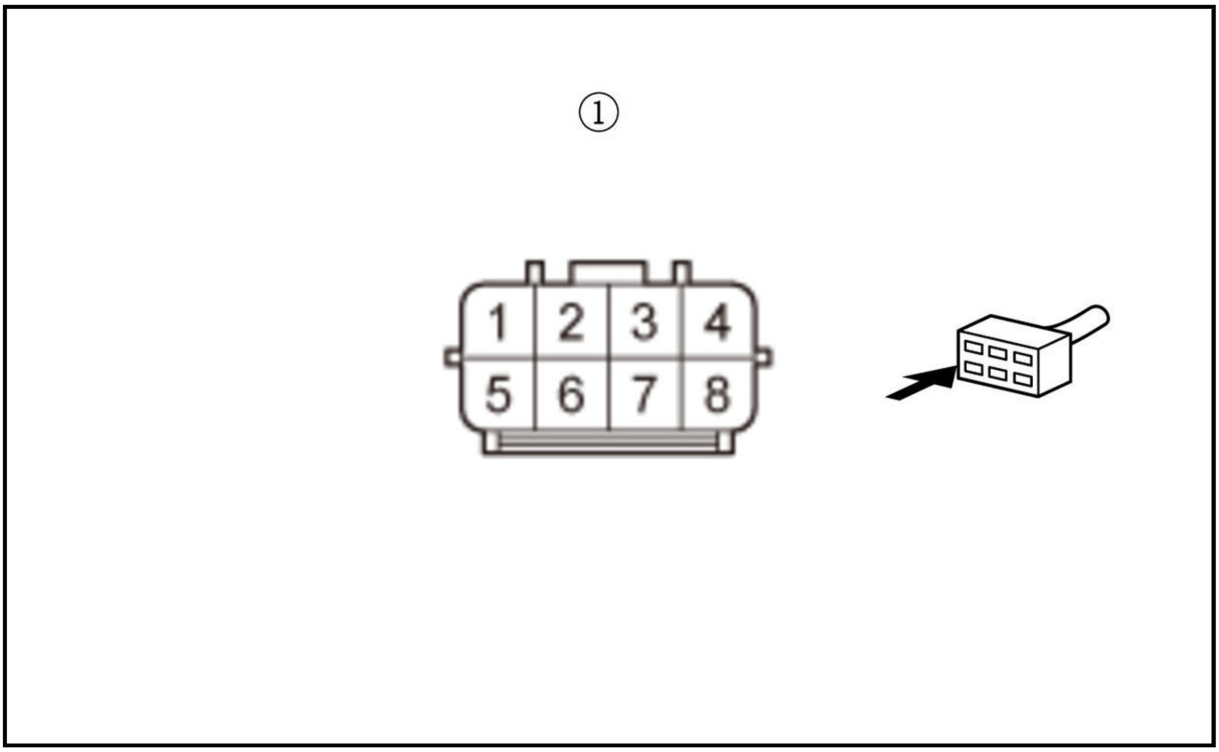
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected Driver's door outer handle 8P connector: jumped to body ground Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 22**
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 3: ①



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected Front passenger's door outer handle 8P connector: jumped to body ground Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 25**
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The TS_FR_DR and TS_FR_AS wires are OK. Go to step 15.

NO

Repair an open or high resistance in the wire.

15. Open wire check (+B_BACK_UP line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Each door outer handle 8P connectors: disconnected Each door outer handle 8P connectors: jumped to body ground Body control module connector C (28P): disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector C (28P) No. 27**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACK_UP wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

16. Open wire check (DL_FR_DR, DL_FR_AS lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wires from the door outer handle connectors.

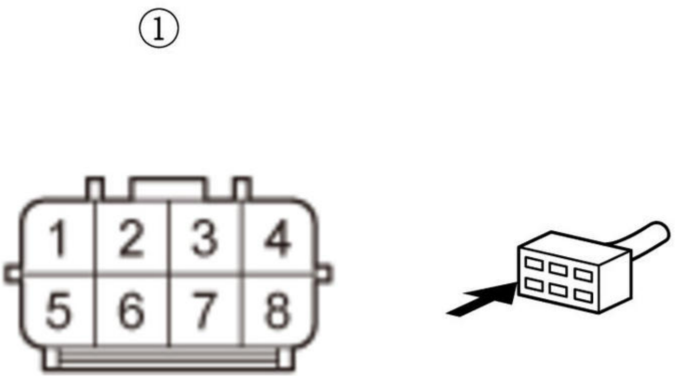
-3. Disconnect the following connector.

Body control module connector G (32P)

-4. Measure the resistance between test points 1 and 2 respectively.

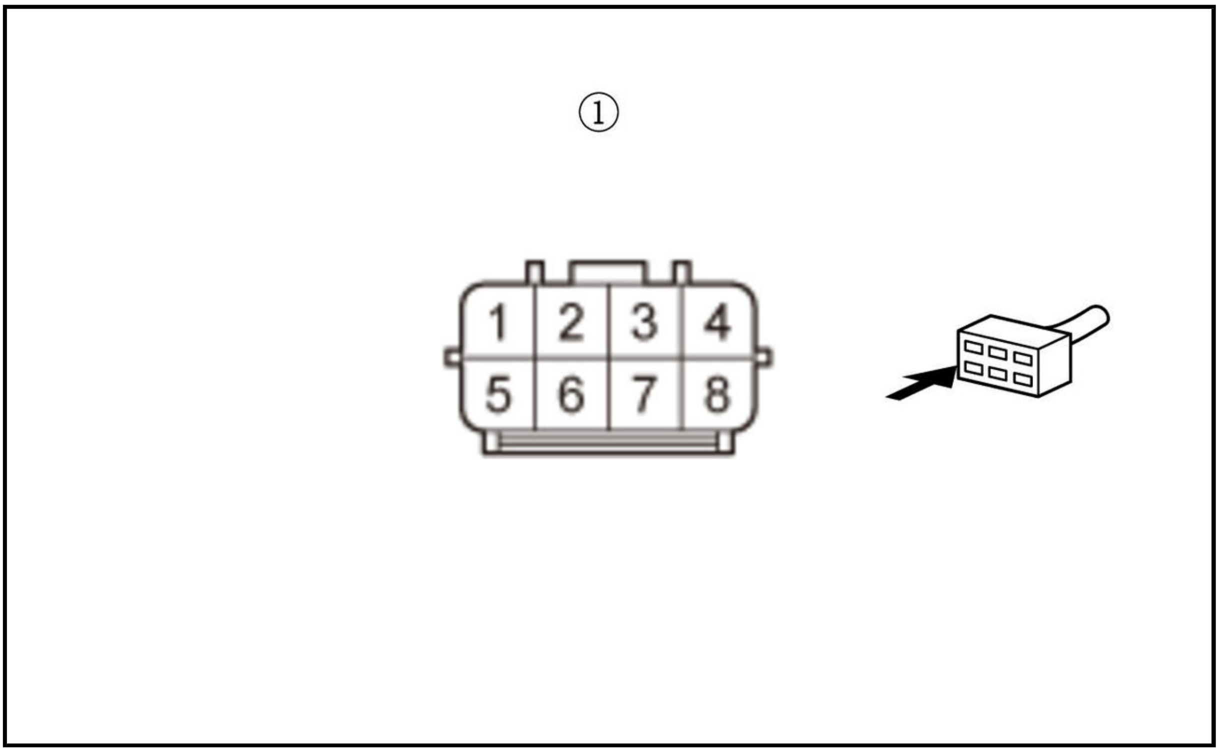
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 19**
Test point 2	Driver's door outer handle 8P connector (female terminals) No. 7: ①



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 1**
Test point 2	Front passenger's door outer handle 8P connector (female terminals) No. 7: ①



Is there 1.0 Ω or less?

YES

The DL_FR_DR and DL_FR_AS wires are OK. Go to step 17.

NO

Repair an open or high resistance in the wire.

17. Open wire check (+B_BACK_UP line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Each door outer handle 8P connectors: disconnected Body control module connector C (28P): disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector C (28P) No. 27**
Test point 2	Body ground

Is there battery voltage?

YES

The +B_BACK_UP wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - THE DOORS WILL NOT UNLOCK OR LOCK WITH THE KEYLESS REMOTE, BUT WILL UNLOCK OR LOCK WITH THE

DOOR OUTER HANDLES

1. Door lock actuator operation check 1

   -1. Put out all the keyless remotes from inside the vehicle, and close all doors and tailgate.

   -2. Press each LOCK and UNLOCK buttons of the keyless remote, at least ten times.

   Do the door lock actuators work normally?

   YES

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

   NO

   Go to step 2.

2. Keyless access system check 1

   -1. Open the driver's door.

   Does the key-in reminder sound?

   YES

   Replace the body control module .

   NO

   Go to step 3.

3. Keyless access system check 2

   -1. Turn the vehicle to the ON mode.

   Does the system change to ON mode?

   YES

   Go to step 5.

   NO

   Go to step 4.

4. Keyless access system check 3

   -1. With driver's power window open and all of the doors closed, turn the vehicle to the OFF (LOCK) mode.

   -2. Put out all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

   -3. Press the power switch. The MID should request the keyless remote to touch the power switch. The LED on the power switch will flash for up to 30 seconds.

   -4. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

   Does the system change to ON mode?

YES

Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access, but can select ON mode with the keyless remote touching the power switch".

NO

Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access and with the keyless remote touching the power switch".

5. PCU and keyless access DTC check

-1. Check for PCU and keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Go to indicated DTC troubleshooting.

NO

Go to step 6.

6. Determine possible failure area (keyless remote, others)

-1. **Do the keyless access remote check using the all keyless remotes** .

Are the all keyless remotes OK?

YES

Go to step 7.

NO

Replace the keyless remote and recheck.

7. Door lock actuator operation check 2

-1. Turn the vehicle to the OFF (LOCK) mode, and close all doors.

-2. Lock and unlock the doors with the driver's door touch sensors, and lock and unlock the doors with the front passenger's door touch sensors.

Do the door lock actuators work normally?

YES

Do the input test for the body control module , and do all power, ground, and communication input tests. If the body control module input tests prove OK, **replace the body control module** .

NO

Check the B-CAN system DTCs. If not, check the door lock system.

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING - THE ENGINE STARTS BUT STALLS IMMEDIATELY

1. Keyless access system check 1

   -1. Check the security indicator.

   Does the security indicator blinking?

   YES

   Go to step 3.

   NO

   Go to step 2.

2. Gauge control module check

   -1. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.

   Self diagnostic function - GAUGES

   Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

   Does the security indicator blinking?

   YES

   Go to the PGM-FI system troubleshooting.

   NO

   Replace the gauge control module .

3. Keyless access system check 2

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter KEYLESS ACCESS SYSTEM INFORMATION.

   One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK 1

   One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK 2

   Do the SYSTEM CHECK 1 and 2 with the HDS.

   Are N-1 OK and N-2 OK indicated?

   YES

   Go to step 4.

   NO

   Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 1 and 2.

4. Keyless access system check 3

-1. With driver's power window open and all of the doors closed, turn the vehicle to the OFF (LOCK) mode.

-2. Put out all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

-3. Press the power switch. The MID should request the keyless remote to touch the power switch. The LED on the power switch will flash for up to 30 seconds.

-4. Touch the power switch with the keyless remote. The buttons on the keyless remote should be facing you.

-5. Try to start the engine.

Does the engine start?

YES

Go to step 5.

NO

Go to step 6.

5. PGM-FI DTC check

-1. Check for PGM-FI DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

Are any DTCs indicated?

YES

Troubleshoot the PGM-FI DTCs.

NO

Replace the body control module .

6. Keyless access system check 4

-1. Select BACKUP CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.

One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK

Do the SYSTEM CHECK with the HDS.

Is N-1 OK indicated?

YES

Go to step 7.

NO

Troubleshoot the backup control unit according to the result of the SYSTEM CHECK.

7. Body control module check (substitution)

-1. **Substitute a known-good body control module** .

-2. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, then select REPLACE KEYLESS ACCESS CONTROL UNIT.

-3. Turn the vehicle to the ON mode.

Does the system change to ON mode?

YES

Replace the original body control module .

NO

Go to the PGM-FI system troubleshooting.

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM SYMPTOM TROUBLESHOOTING - AUTO DOOR UNLOCK DOES NOT WORK

NOTE:

- Before troubleshooting, make sure the fuses and **relays** associated with the system is OK.
- There are two pairs of fuses in the same circuit (L SIDE DOOR LOCK and UNLOCK circuits, R SIDE DOOR LOCK and UNLOCK circuits, DR DOOR LOCK and UNLOCK circuits). If one circuit's fuse is blown, make sure to check the other circuit's fuse in the same circuit. If necessary, replace the blown fuse(s).
- Check if Auto Door Unlock feature selected OFF, under MID customized settings for each remote transmitter: Driver 1 and 2. Make sure to test operation of each Auto Door Unlock setting to check function.

1. Abnormal circuit check 1

-1. **Connect the HDS to the data link connector (DLC)** .

-2. Select DOOR LOCKS from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS, and enter FUNCTIONAL TESTS.

BODY ELECTRICAL - DOOR LOCKS - Functional Tests - Inspection

Select UNLOCK ALL DOORS with the HDS.

Do the door lock actuators work normally?

YES

Go to step 18.

NO

Driver's door lock circuit: go to step 2.

NO

Front passenger's door lock circuit: go to step 6.

NO

Left rear door lock circuit: go to step 10.

NO

Right rear door lock circuit: go to step 14.

2. Determine possible failure area (driver's door lock actuator, others)

-1. Disconnect the following connector.

Driver's door latch 10P connector

-2. **Test the driver's door lock actuator**.

Is the door lock actuator OK?

YES

Go to step 3.

NO

Faulty door lock actuator; **replace the driver's door latch** .

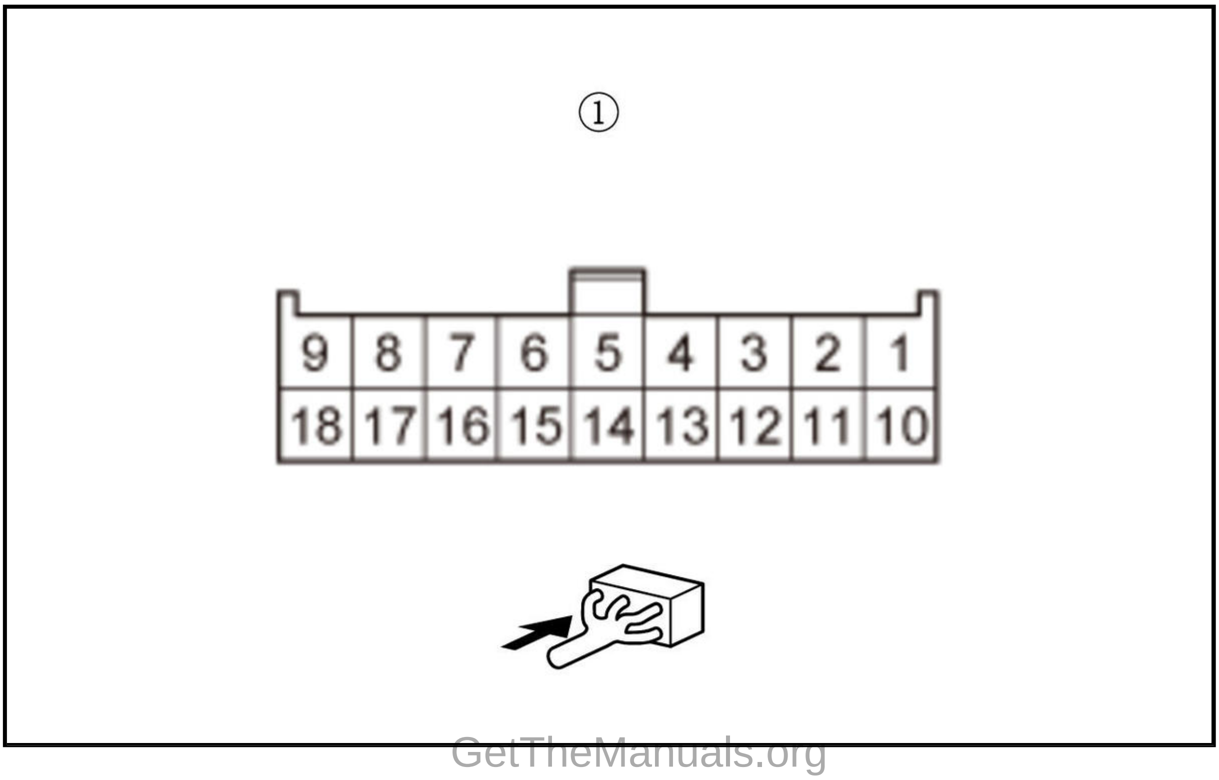
3. Open wire check (DR_DOOR_UNLOCK line)

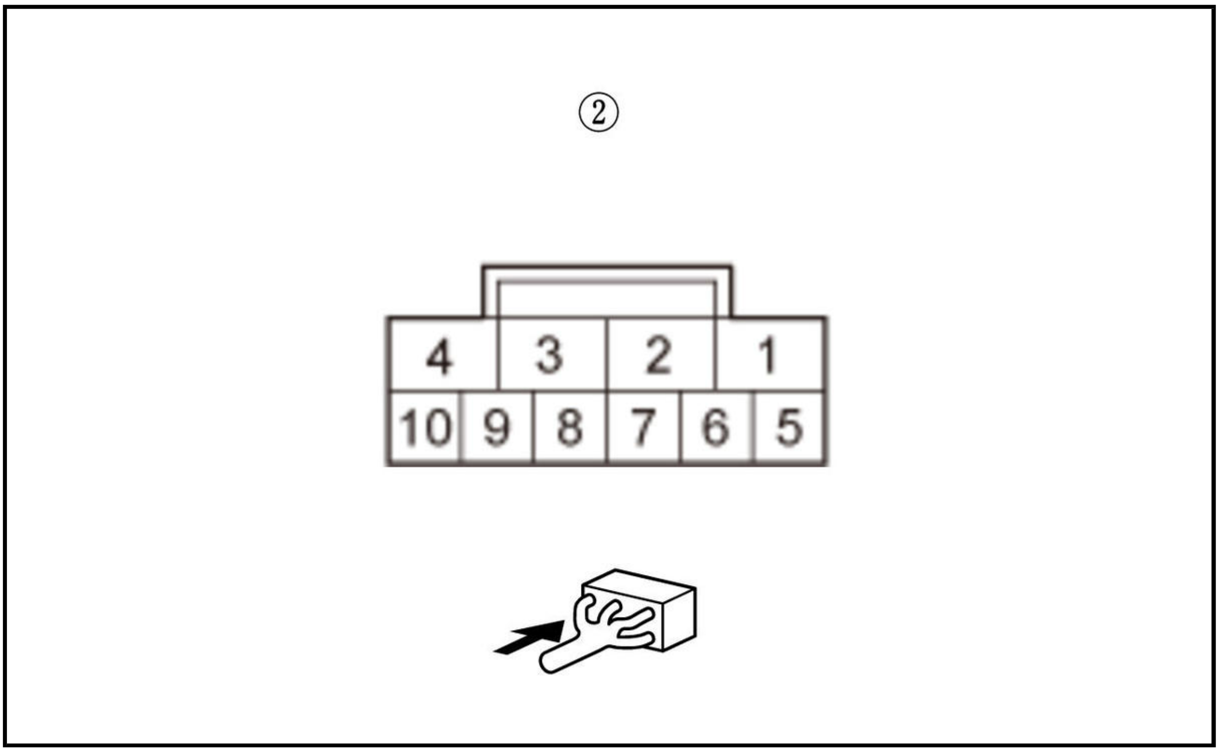
-1. Disconnect the following connector.

Under-dash fuse/relay box connector E (18P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Under-dash fuse/relay box connector E (18P): disconnected Driver's door latch 10P connector: disconnected
Test point 1	Under-dash fuse/relay box connector E (18P) (female terminals) No. 16: ①
Test point 2	Driver's door latch 10P connector (female terminals) No. 1: ②





Is there 1.0 Ω or less?

YES

The DR_DOOR_UNLOCK wire is OK. Go to step 4.

NO

Repair an open or high resistance in the wire.

4. Open wire check (DR_DOOR_LOCK line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Under-dash fuse/relay box connector E (18P): disconnected Driver's door latch 10P connector: disconnected

-1. Disconnect the following connectors.

Body control module connector B (36P) Under-dash fuse/relay box connector G (20P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Under-dash fuse/relay box connector E (18P): disconnected Under-dash fuse/relay box connector G (20P): disconnected Body control module connector B (36P): disconnected Driver's door latch 10P connector: disconnected

The DR_DOOR_UNLOCK_RELAY_CL- wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

6. Determine possible failure area (front passenger's door lock actuator, others)

-1. Disconnect the following connector.

Front passenger's door latch 10P connector

-2. **Test the front passenger's door lock actuator**.

Is the door lock actuator OK?

YES

Go to step 7.

NO

Faulty door lock actuator; **replace the front passenger's door latch** .

7. Open wire check (R_SIDE_DOOR_UNLOCK line)

-1. Disconnect the following connector.

Under-dash fuse/relay box connector E (18P)

-2. Measure the resistance between test points 1 and 2.

The DOOR_UNLOCK_RELAY_CL- wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

18. Abnormal circuit check 2

-1. Check the parameter(s) below with the HDS when each switch is operating.

Multiplex Control Unit, Door (Power Window Master Switch)

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Signal	Current conditions	
	Value	Unit
Driver's Door Switch	B	B
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is each switch information OK?

YES

Replace the body control module .

NO

Driver's door switch circuit: go to step 19.

NO

Driver's door lock knob switch circuit: go to step 21.

NO

Front passenger's door lock knob switch circuit: go to step 27.

NO

Left rear door lock knob switch circuit: go to step 33.

NO

Right rear door lock knob switch circuit: go to step 39.

19. Driver's door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

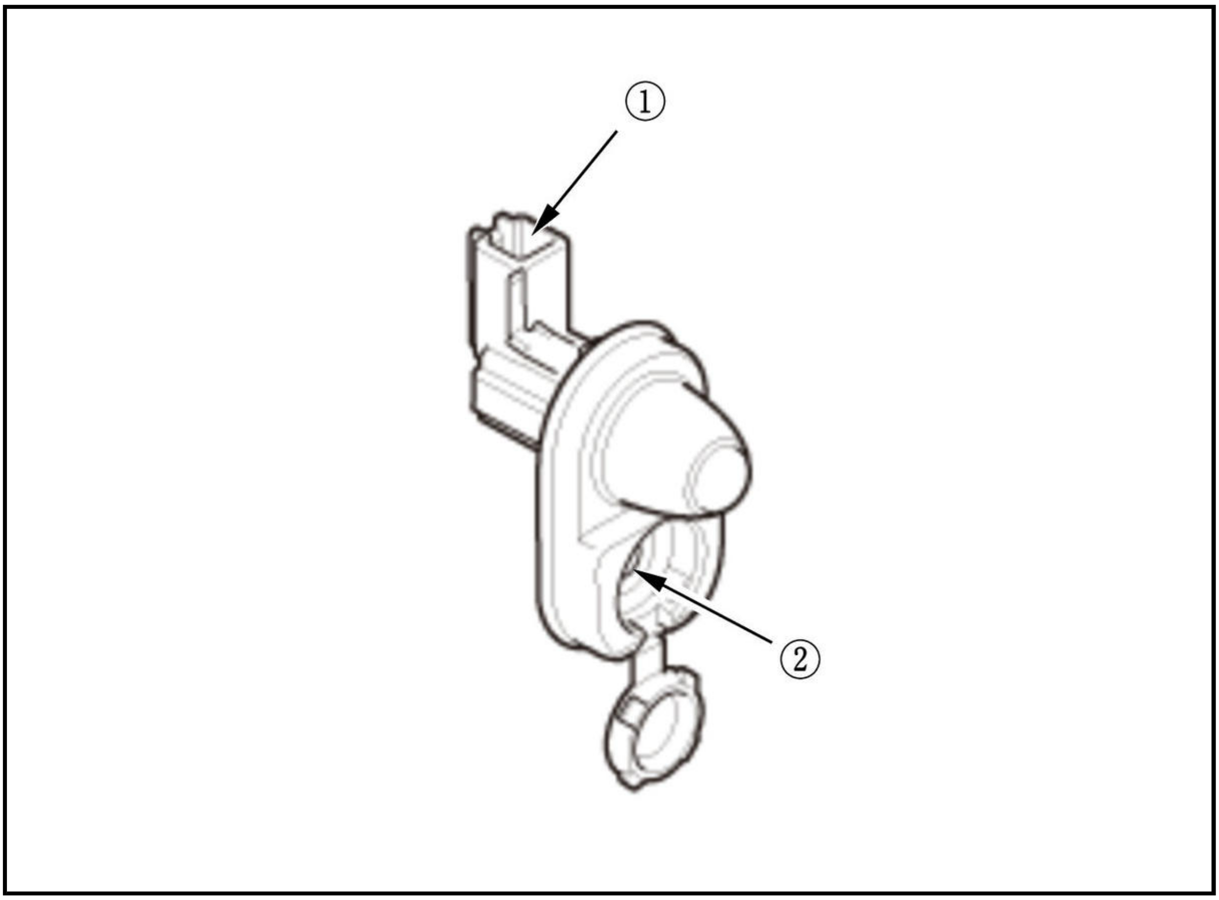
-2. Remove the driver's door switch.

-3. Disconnect the following connector.

Driver's door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Driver's door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 20.

NO

Replace the driver's door switch.

20. Shorted wire check (FL_DOOR_SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected Driver's door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The FL_DOOR_SW wire is OK. **Replace the body control module** .

NO

Repair a short to ground in the wire.

21. Keyless/power door locks/security system check 1

-1. With the driver's door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 22.

NO

Go to step 24.

22. Determine possible failure area (driver's door lock knob switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B

Is information value OFF?

YES

Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Go to step 23.

23. Shorted wire check (DR_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected Power window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**

Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DR_SILCON_UNLOCK wire is OK. **Replace the power window master switch** .

NO

Repair a short to ground in the wire.

24. Keyless/power door locks/security system check 2

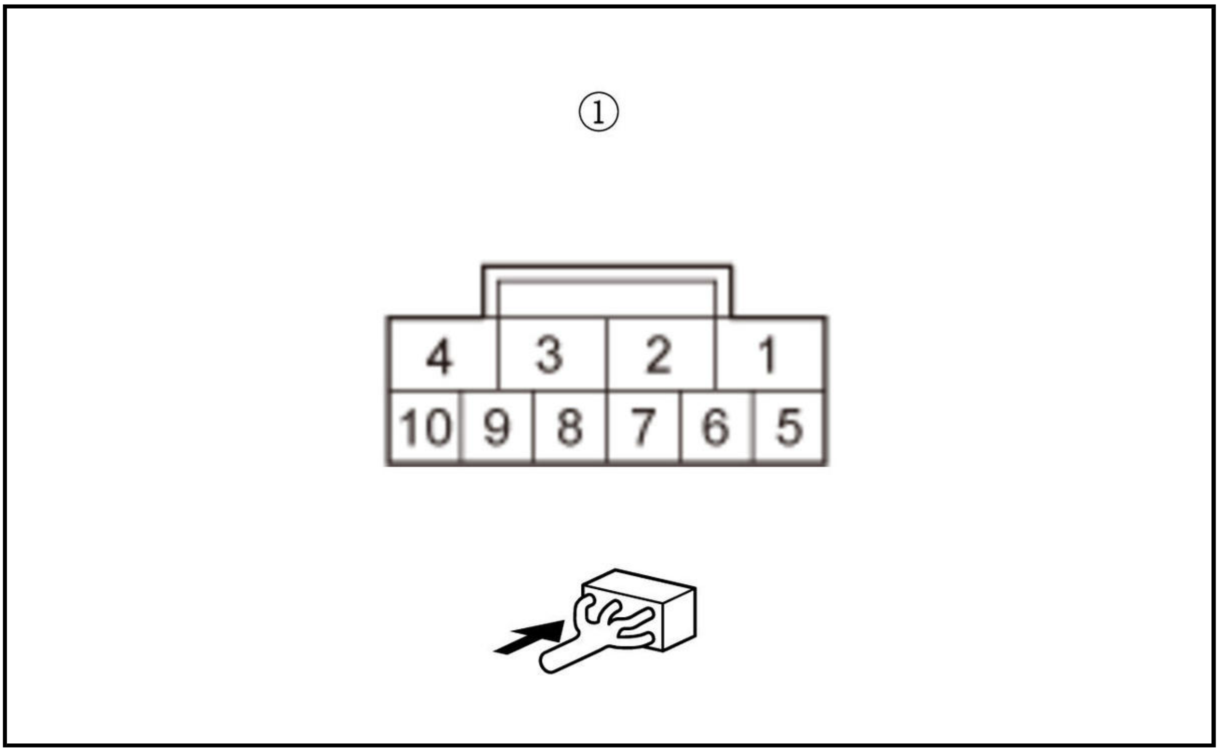
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door latch 10P connector (female terminals) No. 5: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 25.

NO

Go to step 26.

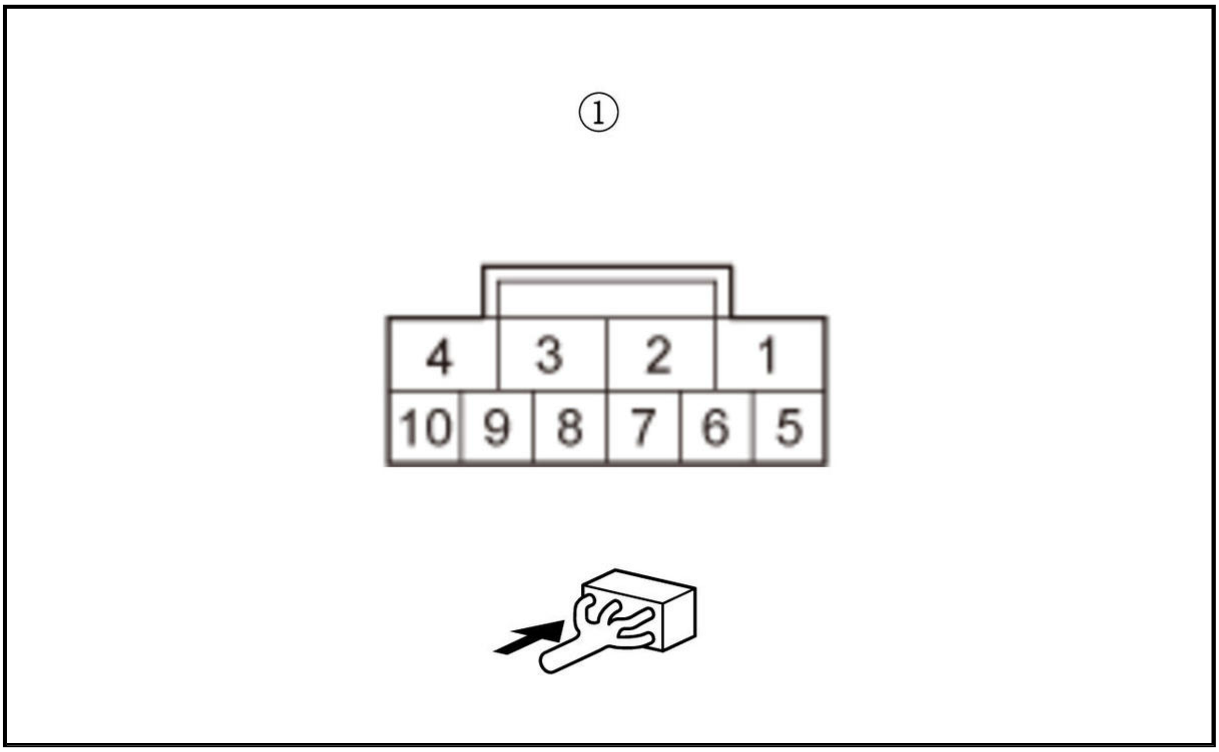
25. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected
Test point 1	Driver's door latch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Repair an open or high resistance in the wire or poor ground (G401).

26. Open wire check (DR_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 20**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The DR_SILCON_UNLOCK wire is OK. **Replace the power window master switch** .

27. Keyless/power door locks/security system check 1

-1. With the front passenger's door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information indicator ON?

YES

Go to step 28.

NO

Go to step 30.

28. Determine possible failure area (front passenger's door lock knob switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value OFF?

YES

Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

NO

Go to step 29.

29. Shorted wire check (AS_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's power window switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's door latch 10P connector: disconnected Front passenger's power window switch 37P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 36**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The AS_SILCON_UNLOCK wire is OK. **Replace the front passenger's power window switch** .

NO

Repair a short to ground in the wire.

30. Keyless/power door locks/security system check 2

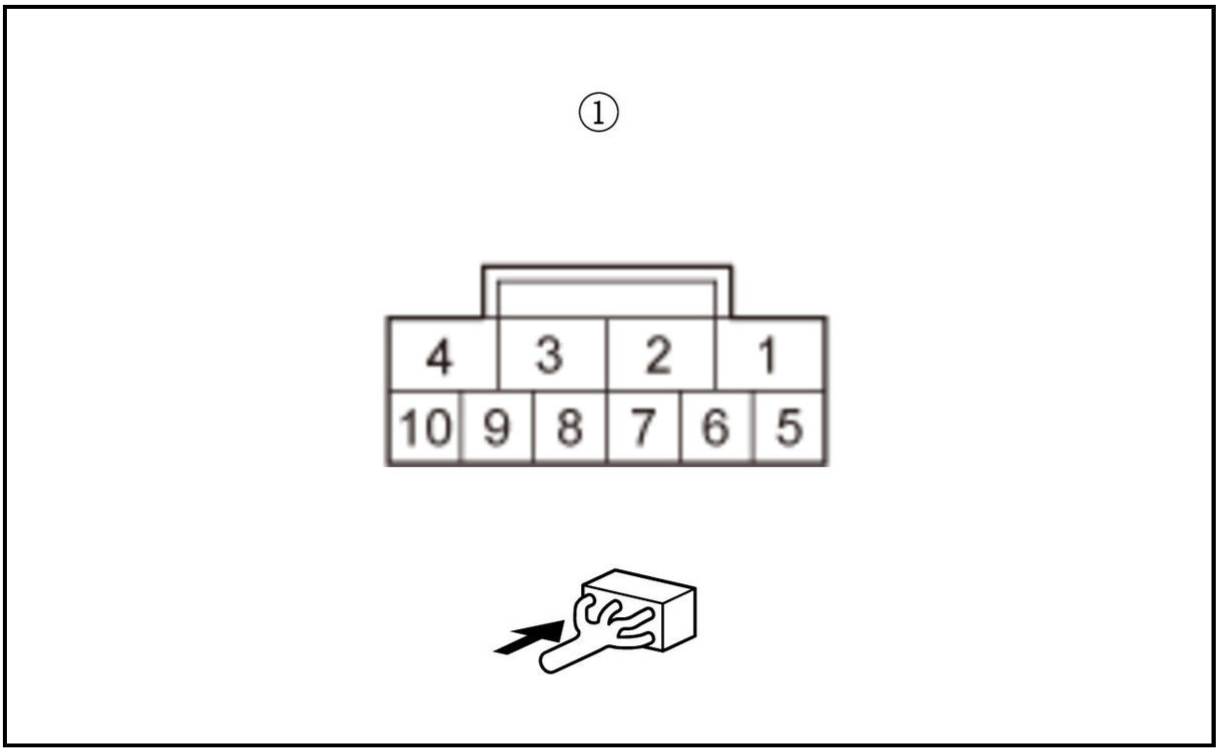
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's door latch 10P connector (female terminals) No. 10: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 31.

NO

Go to step 32.

31. Open wire check (GND line)

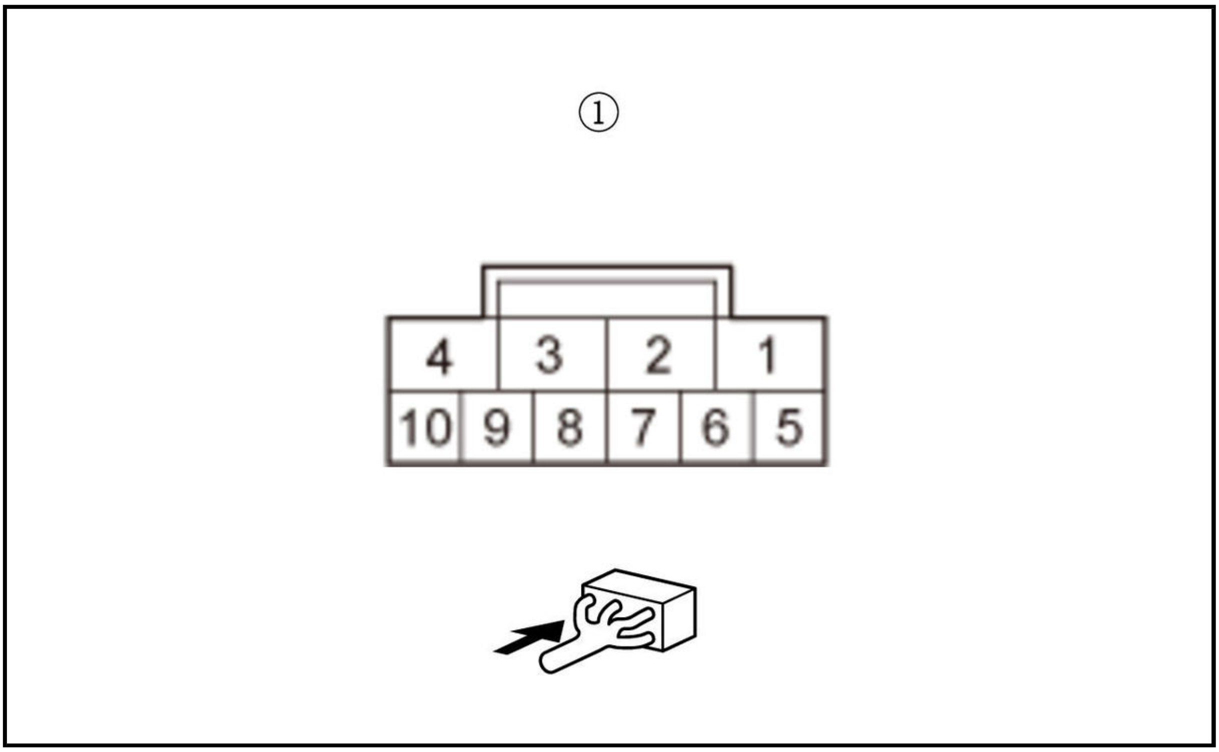
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's door latch 10P connector: disconnected

Test point 1	Front passenger's door latch 10P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

32. Open wire check (AS_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Front passenger's power window switch 37P connector No. 36**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The AS_SILCON_UNLOCK wire is OK. **Replace the front passenger's power window switch** .

33. Keyless/power door locks/security system check 1

-1. With the left rear door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 34.

NO

Go to step 36.

34. Determine possible failure area (left rear door lock knob switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Left rear door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information value OFF?

YES

Faulty left rear door lock knob switch; **replace the left rear door latch** .

NO

Go to step 35.

35. Shorted wire check (RR_L_SILCON_UNLOCK line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Left rear door latch 10P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 15**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RR_L_SILCON_UNLOCK wire is OK. **Replace the body control module** .

NO

Repair a short to ground in the wire.

36. Keyless/power door locks/security system check 2

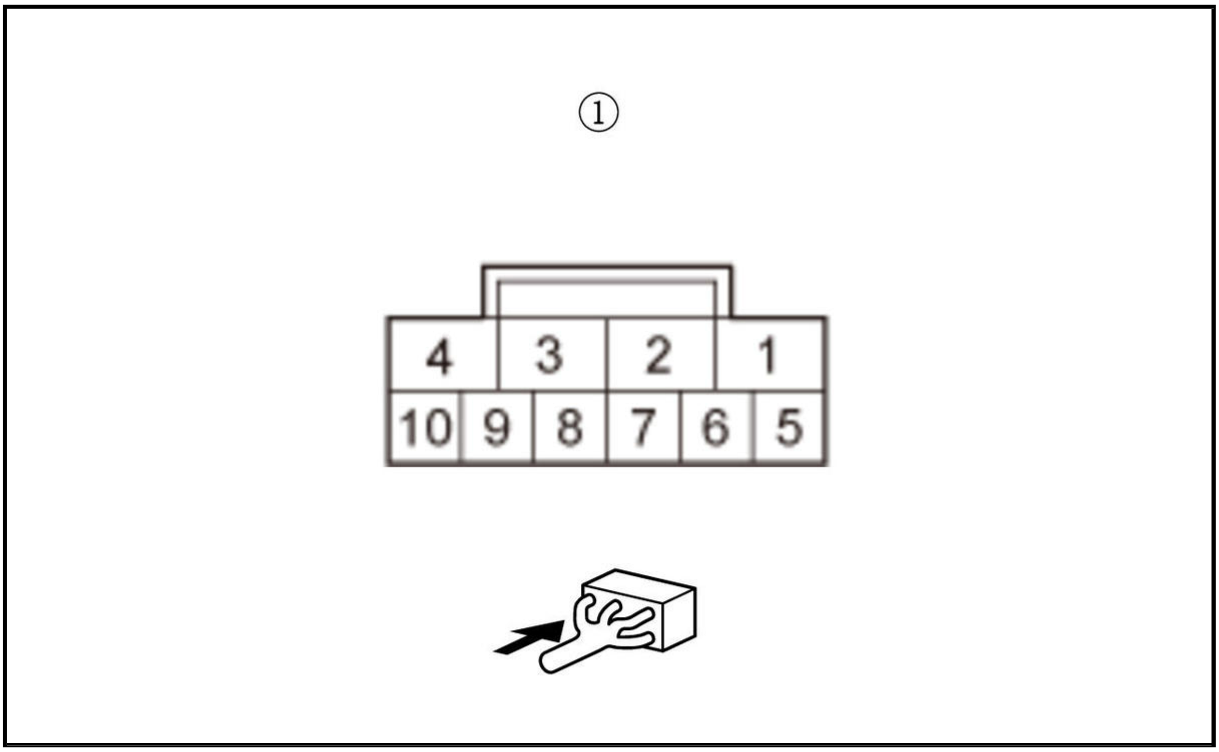
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Left rear door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Left rear door latch 10P connector (female terminals) No. 9: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 37.

NO

Go to step 38.

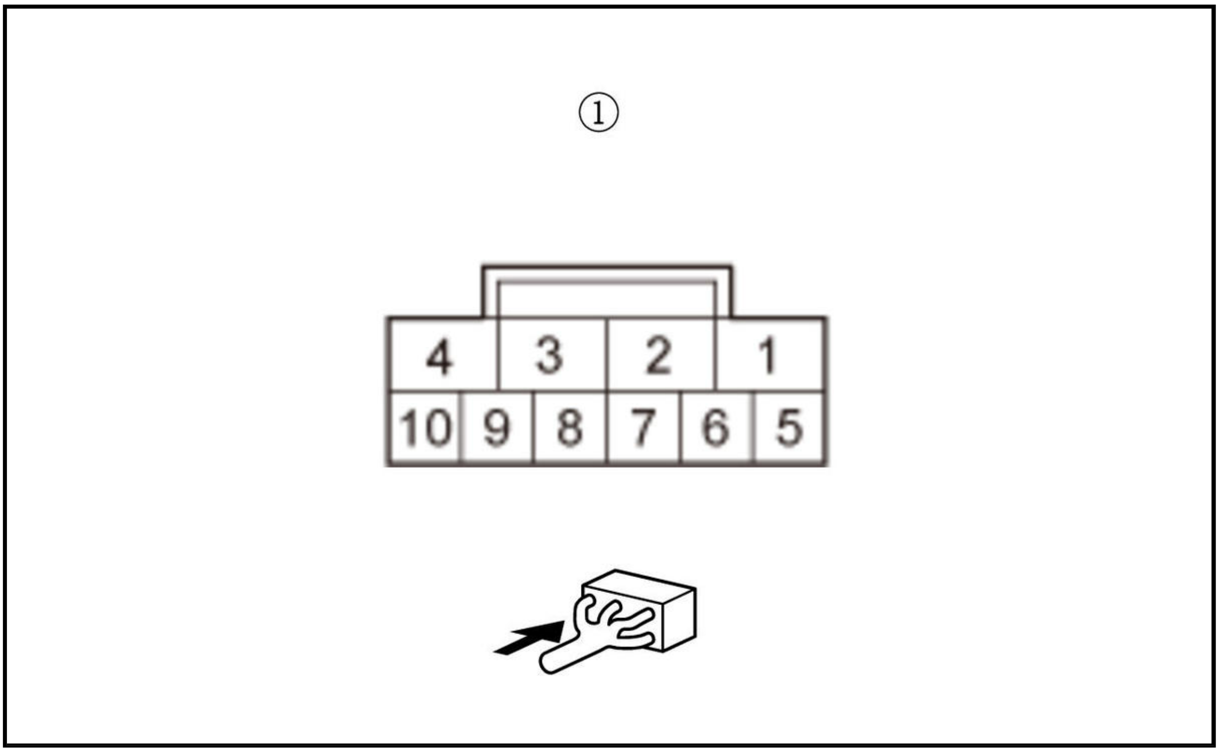
37. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear door latch 10P connector: disconnected
Test point 1	Left rear door latch 10P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty left rear door lock knob switch; replace the left rear door latch .

NO

Repair an open or high resistance in the ground wire or poor ground (G501).

38. Open wire check (RR_L_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Body control module connector C (28P) No. 15
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RR_L_SILCON_UNLOCK wire is OK. **Replace the body control module** .

39. Keyless/power door locks/security system check 1

-1. With the right rear door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is information value ON?

YES

Go to step 40.

NO

Go to step 42.

40. Determine possible failure area (right rear door lock knob switch, others)

-1. Disconnect the following connector.

Right rear door latch 10P connector

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is information value OFF?

YES

Faulty right rear door lock knob switch; **replace the right rear door latch** .

NO

Go to step 41.

41. Shorted wire check (RR_R_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Right rear door latch 10P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 16**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RR_R_SILCON_UNLOCK wire is OK. **Replace the body control module** .

NO

Repair a short to ground in the wire.

42. Keyless/power door locks/security system check 2

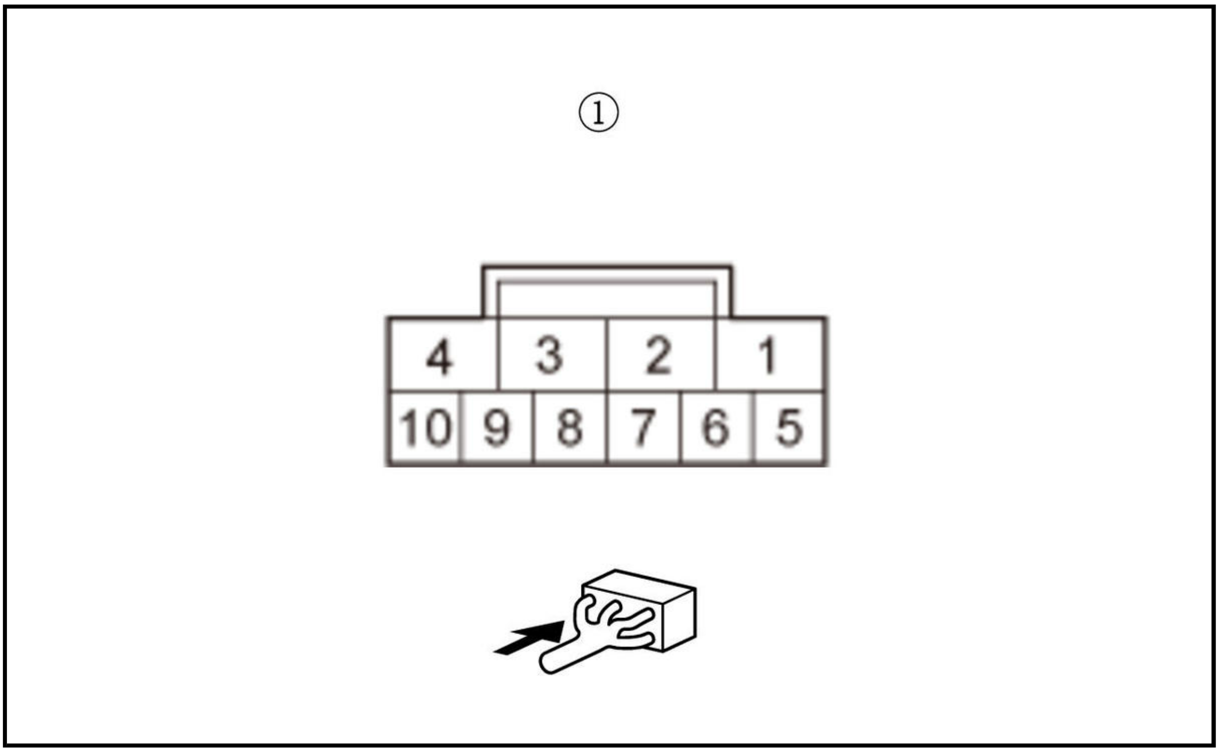
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Right rear door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Right rear door latch 10P connector (female terminals) No. 6: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is information value ON?

YES

Go to step 43.

NO

Go to step 44.

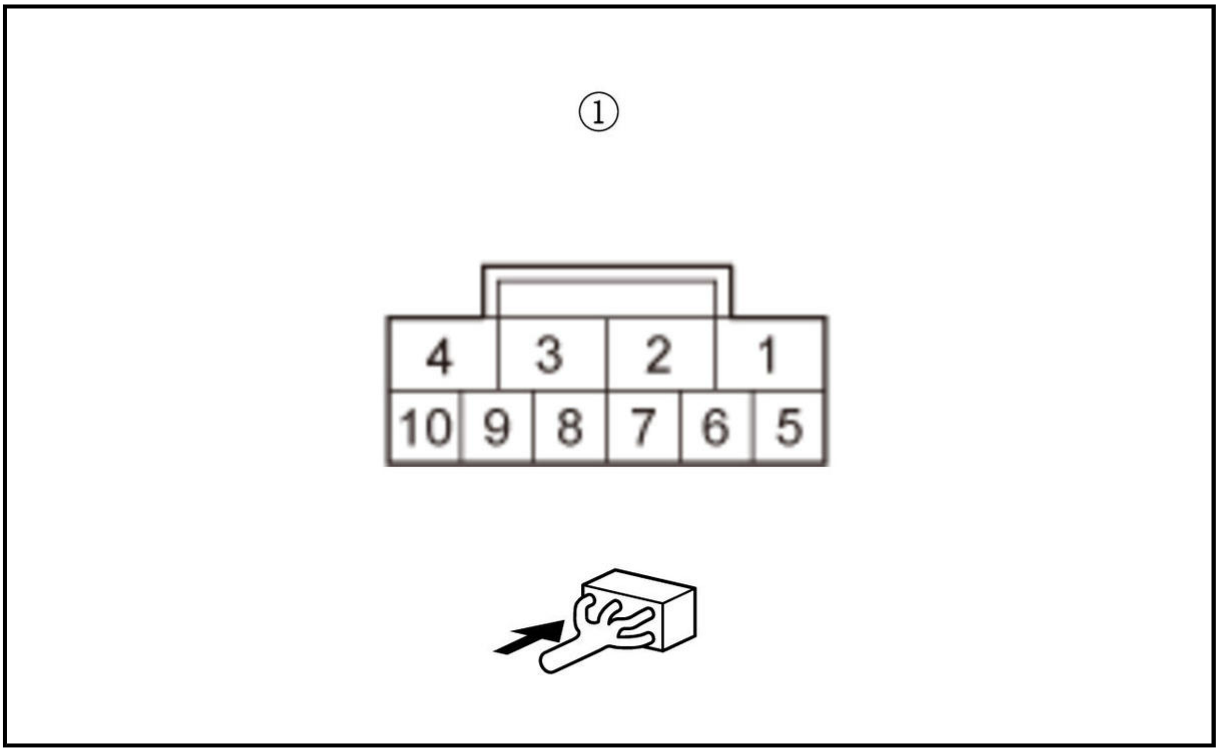
43. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Right rear door latch 10P connector: disconnected
Test point 1	Right rear door latch 10P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty right rear door lock knob switch; replace the right rear door latch .

NO

Repair an open or high resistance in the ground wire or poor ground (G502).

44. Open wire check (RR_R_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector C (28P) No. 16**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RR_R_SILCON_UNLOCK wire is OK. **Replace the body control module** .

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM SYMPTOM TROUBLESHOOTING - DOORS AUTOMATICALLY RELOCK 30 SECONDS AFTER BEING UNLOCKED WITH THE REMOTE EVEN THOUGH A DOOR HAS BEEN OPENED

NOTE: Before troubleshooting, check for B-CAN DTCs. If any DTC is indicated, troubleshoot the indicated DTC first.

1. Determine possible failure area (body control module, others)

-1. With interior light switch: Turn the interior light switch to the DOOR position and ceiling light switch to the MIDDLE position.

-2. Without interior light switch: Turn the ceiling light switch to the MIDDLE position.

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Watch the individual map lights, the ceiling light, and the door indicators on the gauge control module.

Do the individual map lights and door indicators come on when the door is open, and go off when the door is closed?

YES

Replace the body control module .

NO

Go to step 2.

2. Open wire check (FL_DOOR_SW, FR_DOOR_SW, RL_DOOR_SW, RR_DOOR_SW, T/G_SW lines)

-1. Disconnect the following connectors.

Body control module connector D (40P)
Each door switch 1P connector
Power tailgate closer unit connector B (6P) (with power tailgate)
Tailgate latch 4P connector (without power tailgate)

-2. Measure the resistance between test points 1 and 2 respectively.

Is there 1.0 Ω or less?

YES: Door switch

The FL_DOOR_SW, FR_DOOR_SW, RL_DOOR_SW, and RR_DOOR_SW wires are OK. Replace the bad door switch.

YES: Power tailgate closer unit (with power tailgate)

The T/G_SW wire is OK. Faulty Power tailgate closer unit circuit. Check for Power tailgate control unit DTCs.

YES: Tailgate latch switch (without power tailgate)

The T/G_SW wire is OK. Faulty tailgate latch switch or GND line, go to step 3.

NO

Repair an open or high resistance in the wire.

3. Open wire check (GND line)

   -1. Measure the resistance between test points 1 and 2.

2. Keyless/power door locks/security system check 1

   -1. With the power tailgate closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Go to step 3.

NO

Go to step 5.

3. Determine possible failure area (full latch switch, others)

   -1. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Trunk Lid/Tailgate Switch	B	B

Is information value OFF?

YES

Faulty power tailgate full latch switch; **replace the power tailgate closer unit** .

NO

Go to step 4.

4. Shorted wire check (T/G_SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connector.

Is there 1.0 Ω or less?

YES

Go to step 7.

NO

Repair an open or high resistance in the wire.

7. Power Tailgate Latch/Ratchet Switch check

-1. Do the Power Tailgate Latch/Ratchet Switch test

Is the switch OK?

YES

Replace the power tailgate control unit .

NO

Replace the power tailgate closer unit .

8. Open wire check (T/G_SW line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Remove the jumper wire.

   -3. Connect terminals A and B with a jumper wire.

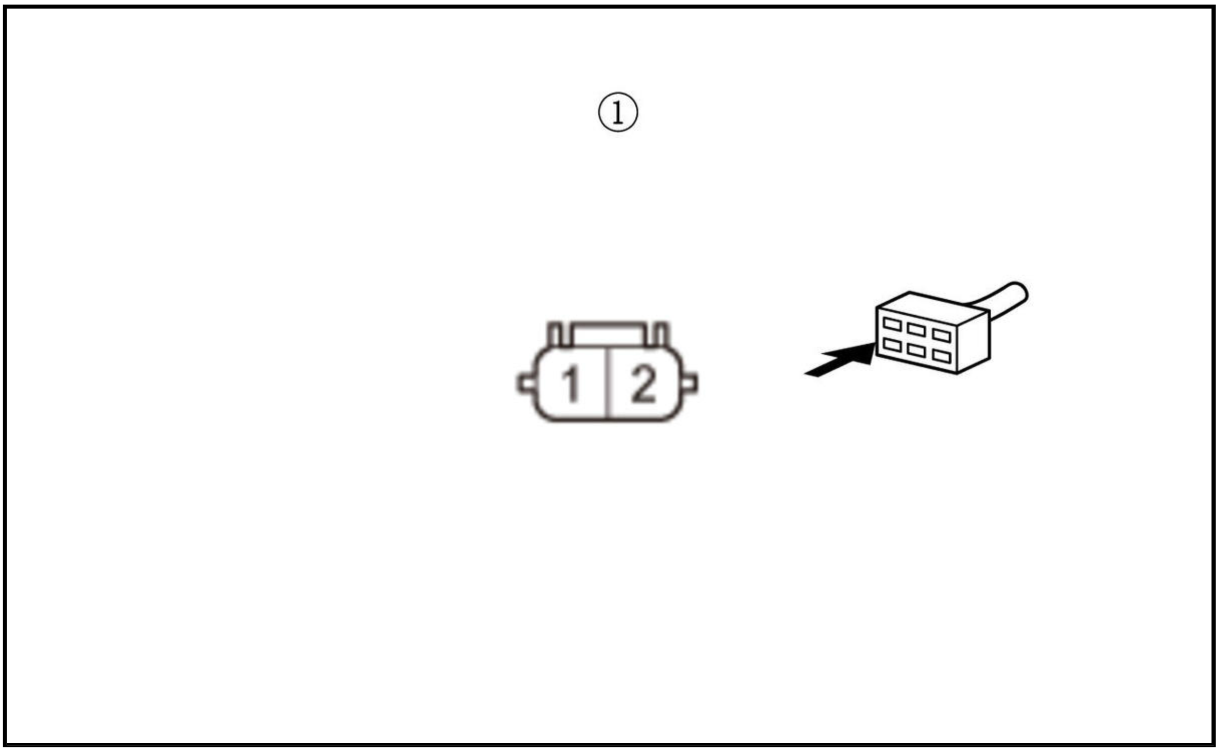
Test condition	Vehicle OFF (LOCK) mode Hood latch switch 2P connector: disconnected
Test point 1	Hood latch switch 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty hood latch switch; **replace the hood latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G251).

20. Open wire check (HOOD_SW line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Relay control module connector A (6P) No. 5**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Security Hood Switch	B	B

Is information value OFF?

YES

Repair an open or high resistance in the wire.

NO

The HOOD_SW wire is OK. Faulty relay control module; **replace the relay control module** .

21. Keyless/power door locks/security system check 1

    -1. With the driver's door lock knob switch in LOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B

    Is information value ON?

    YES

    Go to step 22.

    NO

    Go to step 24.

22. Determine possible failure area (driver's door latch, others)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the following connector.

Driver's door latch 10P connector

    -3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch (UNLOCK)	B	B

    Is information value OFF?

    YES

    Faulty driver's door lock knob switch; **replace the driver's door latch** .

    NO

    Go to step 23.

23. Shorted wire check (DR_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Power window master switch 37P connector: disconnected Driver's door latch 10P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The DR_SILCON_UNLOCK wire is OK. **Replace the power window master switch** .

NO

Repair a short to ground in the wire.

24. Keyless/power door locks/security system check 2

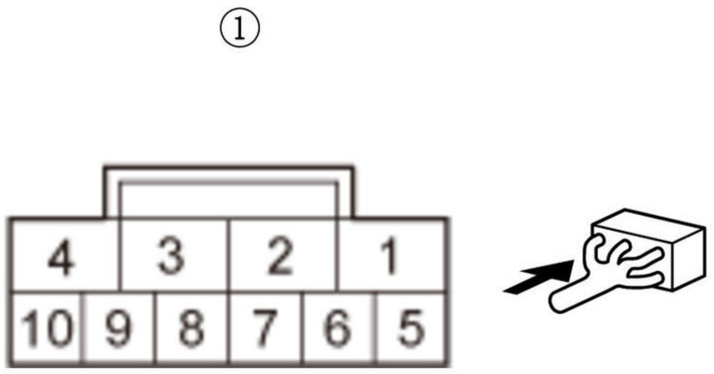
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door latch 10P connector (female terminals) No. 5: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 25.

NO

Go to step 26.

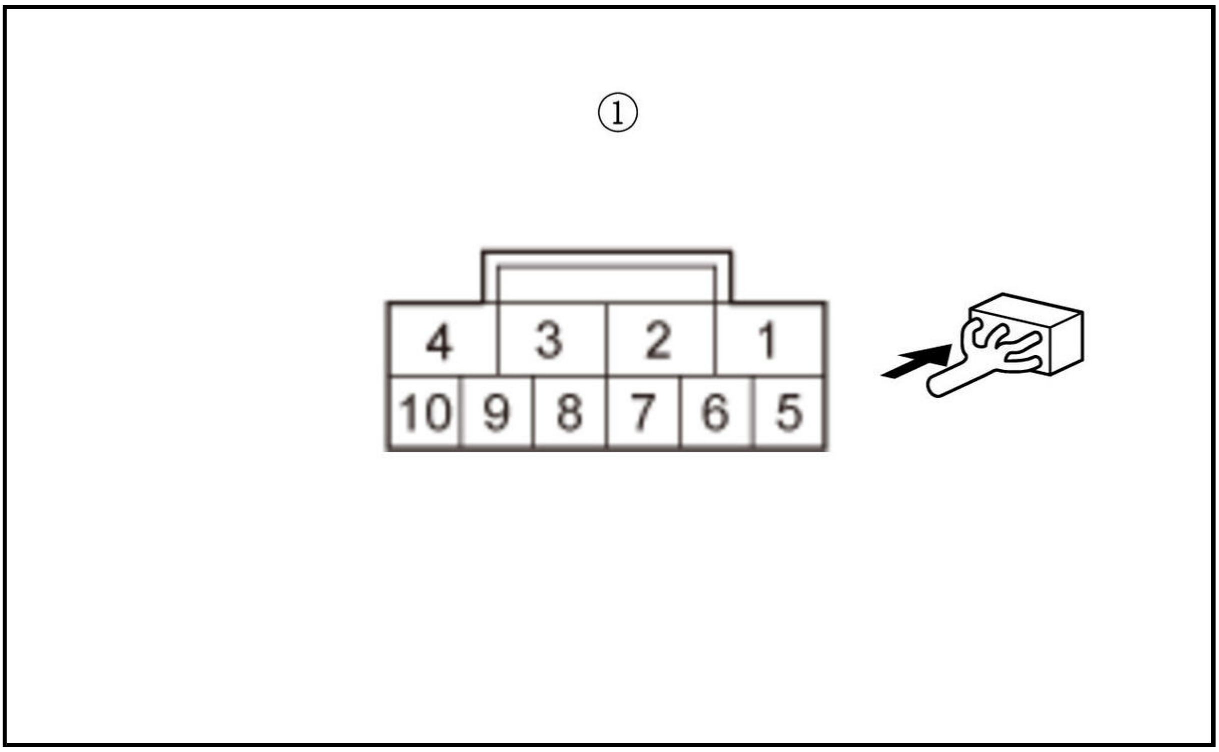
25. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected
Test point 1	Driver's door latch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

26. Open wire check (DR_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 20**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The DR_SILCON_UNLOCK wire is OK. **Replace the power window master switch** .

27. Keyless/power door locks/security system check 1

-1. With the front passenger's door lock knob switch in LOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 28.

NO

Go to step 30.

28. Determine possible failure area (front passenger's door latch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value OFF?

YES

Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

NO

Go to step 29.

29. Shorted wire check (AS_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's power window switch 37P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's power window switch 37P connector: disconnected Front passenger's door latch 10P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 36**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The AS_SILCON_UNLOCK wire is OK. **Replace the front passenger's power window switch** .

NO

Repair a short to ground in the wire.

30. Keyless/power door locks/security system check 2

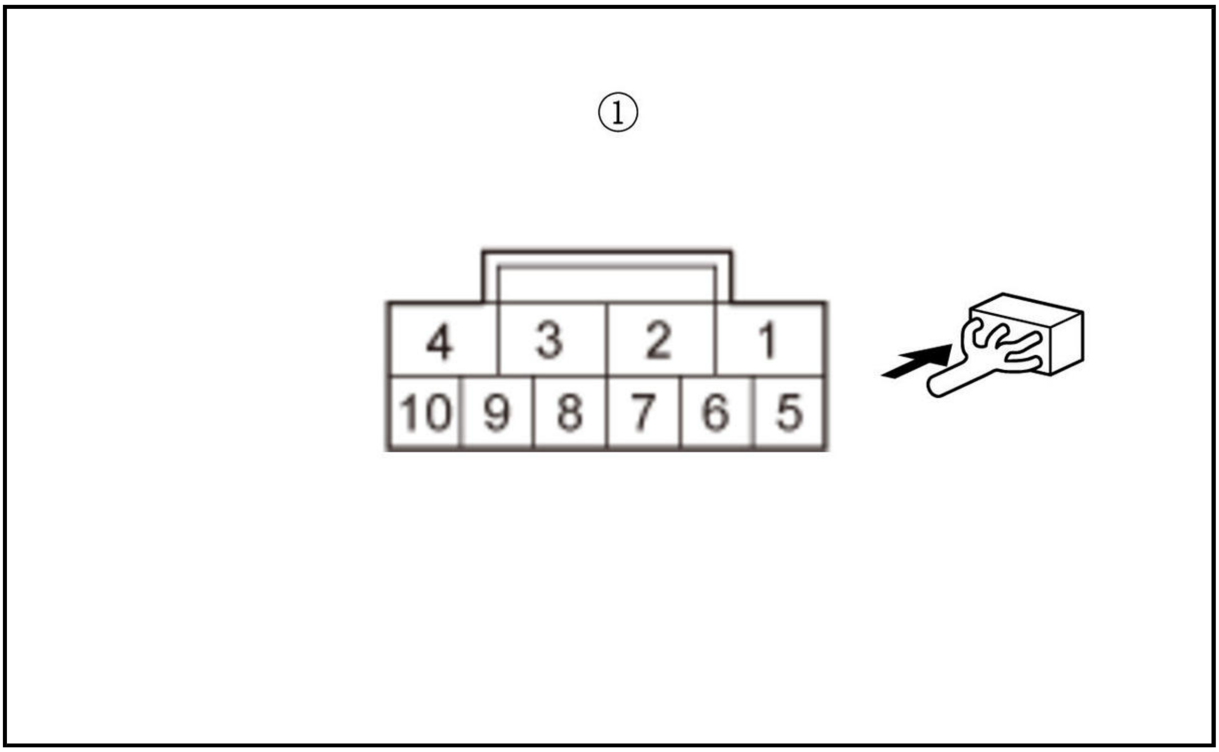
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's door latch 10P connector (female terminals) No. 10: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 31.

NO

Go to step 32.

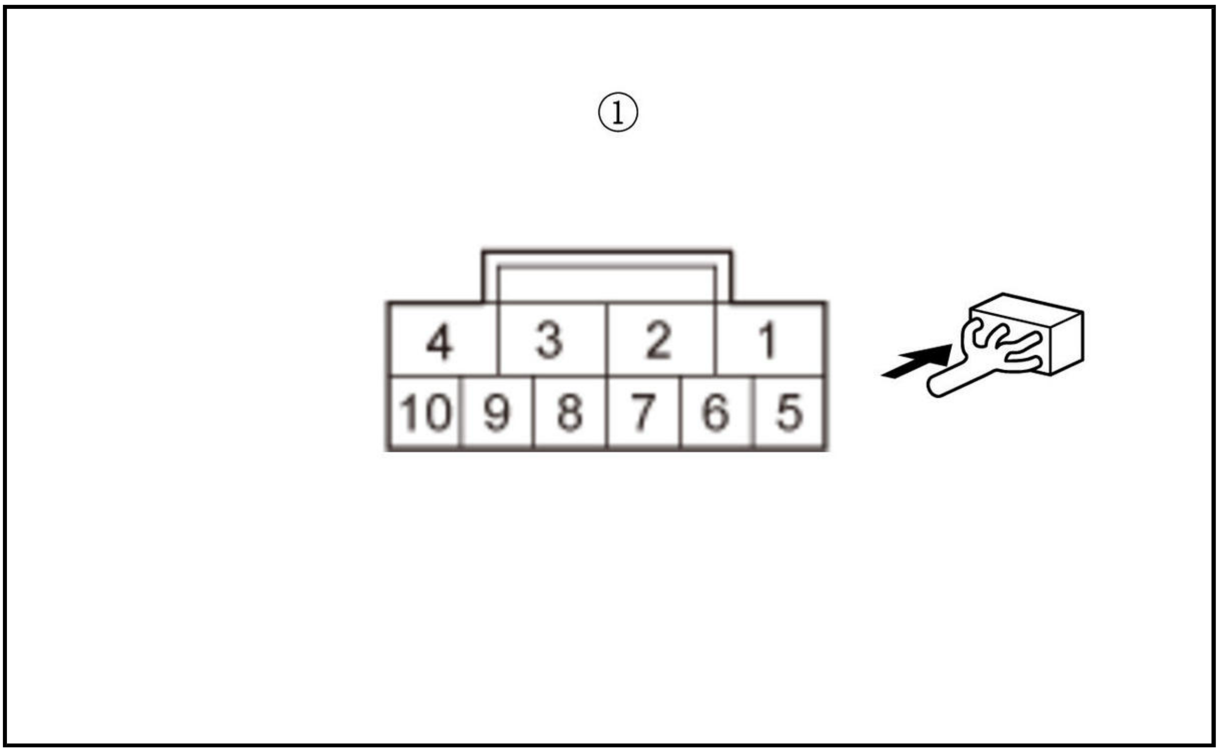
31. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Front passenger's door latch 10P connector: disconnected
Test point 1	Front passenger's door latch 10P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

32. Open wire check (AS_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Front passenger's power window switch 37P connector No. 36**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Passenger's Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The AS_SILCON_UNLOCK wire is OK. **Replace the front passenger's power window switch** .

33. Keyless/power door locks/security system check 1

-1. With the left rear door lock knob switch in LOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information indicator ON?

YES

Go to step 34.

NO

Go to step 36.

34. Determine possible failure area (left rear door latch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Left rear door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information indicator OFF?

YES

Faulty left rear door lock knob switch; **replace the left rear door latch** .

NO

Go to step 35.

35. Shorted wire check (RR_L_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Left rear door latch 10P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 15**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RR_L_SILCON_UNLOCK wire is OK. Faulty body control module; **replace the body control module** .

NO

Repair a short to ground in the wire.

36. Keyless/power door locks/security system check 2

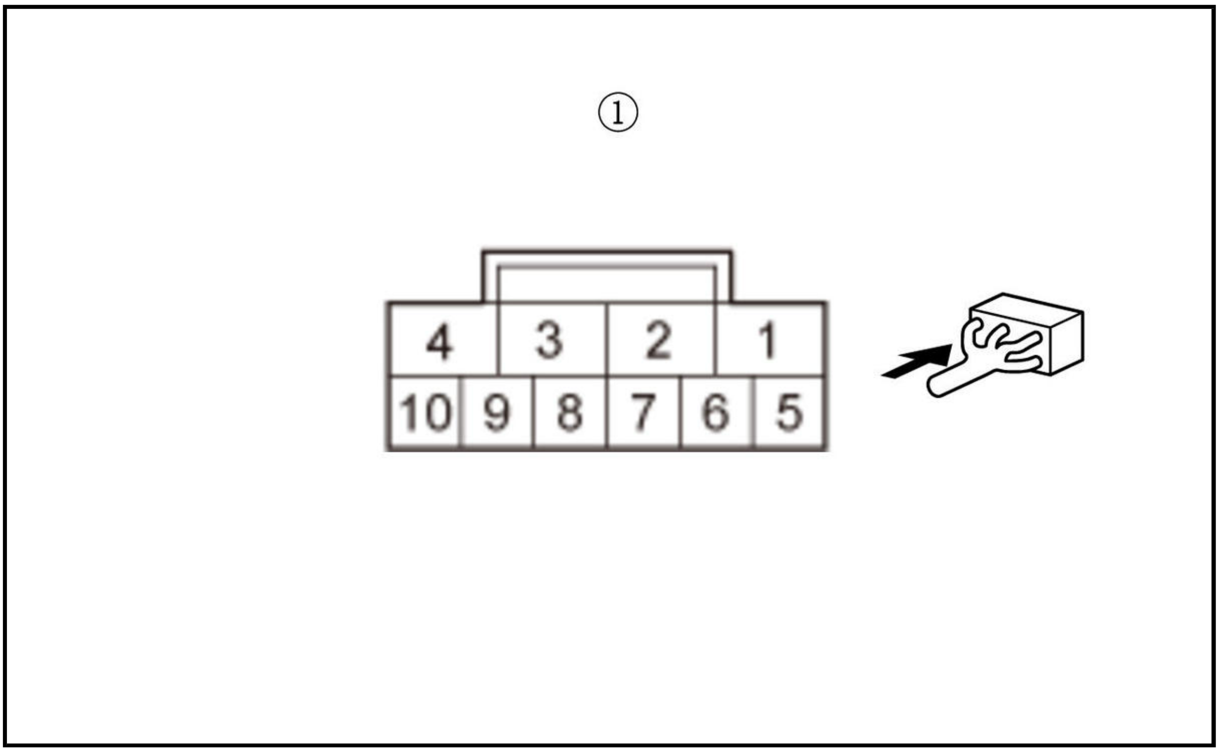
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Left rear door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Left rear door latch 10P connector (female terminals) No. 9: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Go to step 37.

NO

Go to step 38.

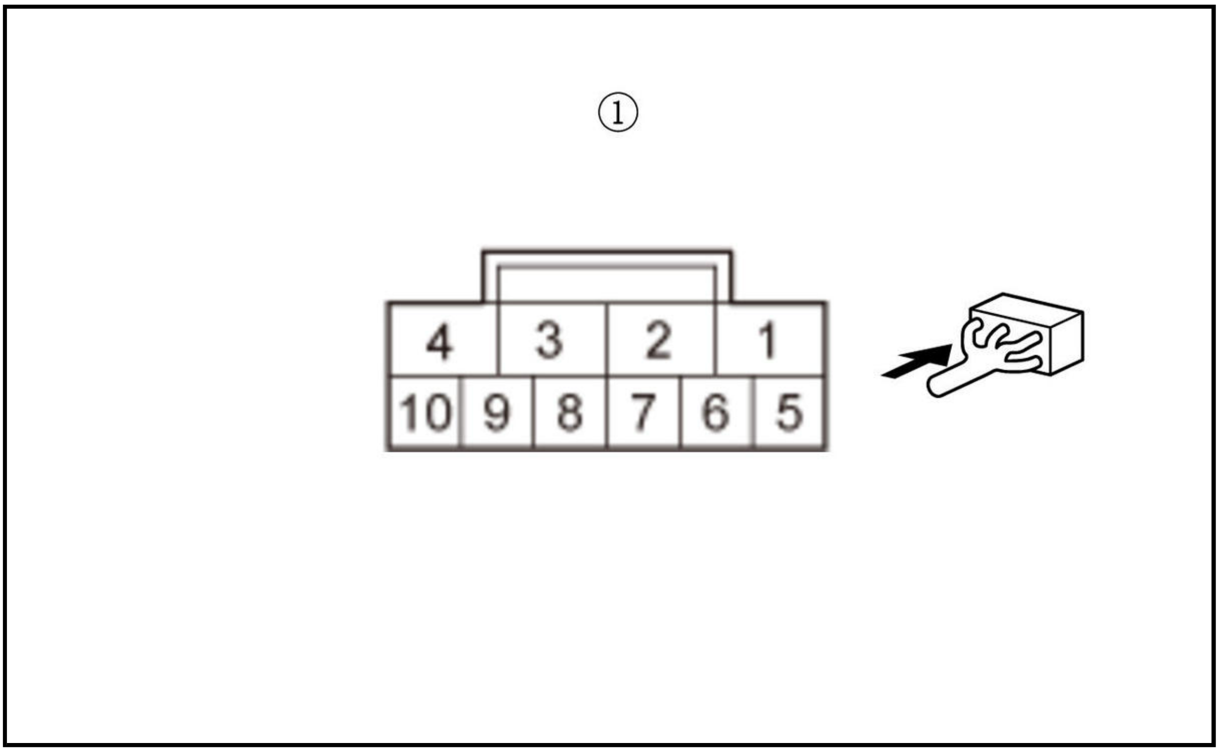
37. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Left rear door latch 10P connector: disconnected
Test point 1	Left rear door latch 10P connector (female terminals) No. 6: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty left rear door lock knob switch; replace the left rear door latch .

NO

Repair an open or high resistance in the ground wire or poor ground (G501).

38. Open wire check (RR_L_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector C (28P) No. 15**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RR_L_SILCON_UNLOCK wire is OK. Faulty body control module; **replace the body control module** .

39. Keyless/power door locks/security system check 1

    -1. With the right rear door lock knob switch in LOCK position, check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Driver's Rear Door Lock Knob Switch (UNLOCK)	B	B

    Is information value ON?

    YES

    Go to step 40.

    NO

    Go to step 42.

40. Determine possible failure area (right rear door latch, others)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the following connector.

Right rear door latch 10P connector

    -3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

    Is information value OFF?

    YES

    Faulty right rear door lock knob switch; **replace the right rear door latch** .

    NO

    Go to step 41.

41. Shorted wire check (RR_R_SILCON_UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector C (28P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector C (28P): disconnected Right rear door latch 10P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 16**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RR_R_SILCON_UNLOCK wire is OK. Faulty body control module; **replace the body control module** .

NO

Repair a short to ground in the wire.

42. Keyless/power door locks/security system check 2

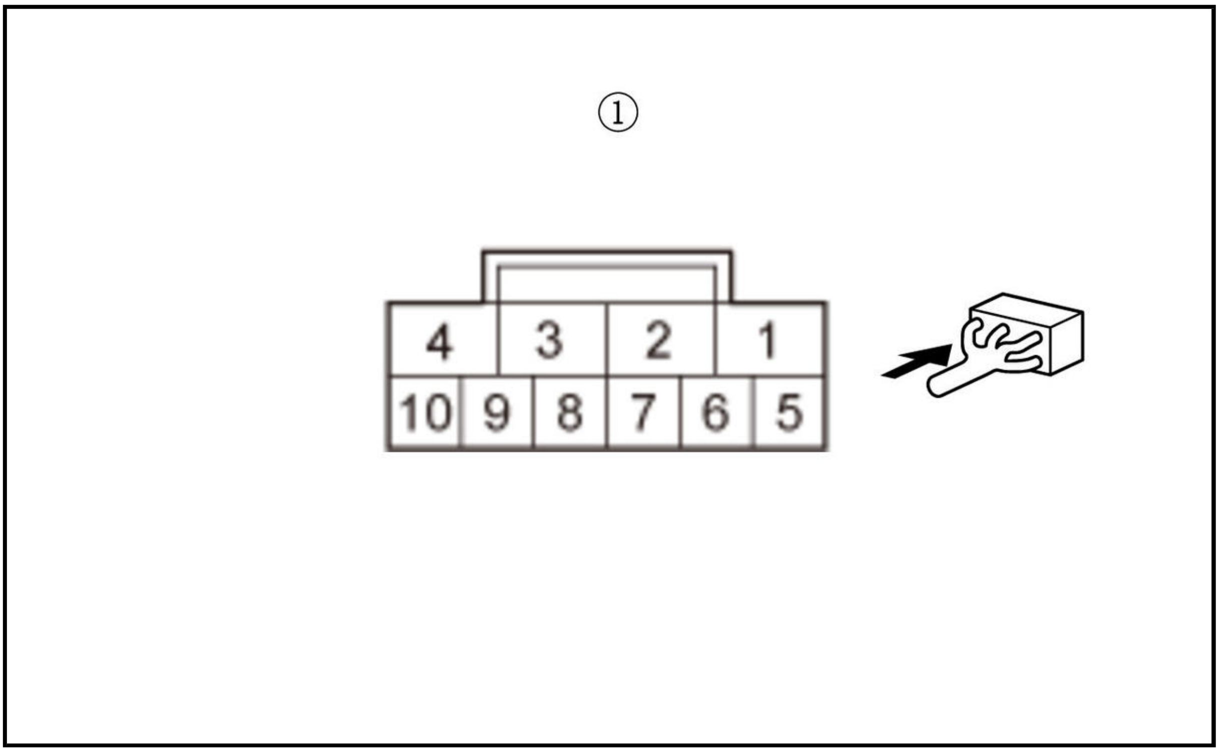
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Right rear door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Right rear door latch 10P connector (female terminals) No. 6: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is information value ON?

YES

Go to step 43.

NO

Go to step 44.

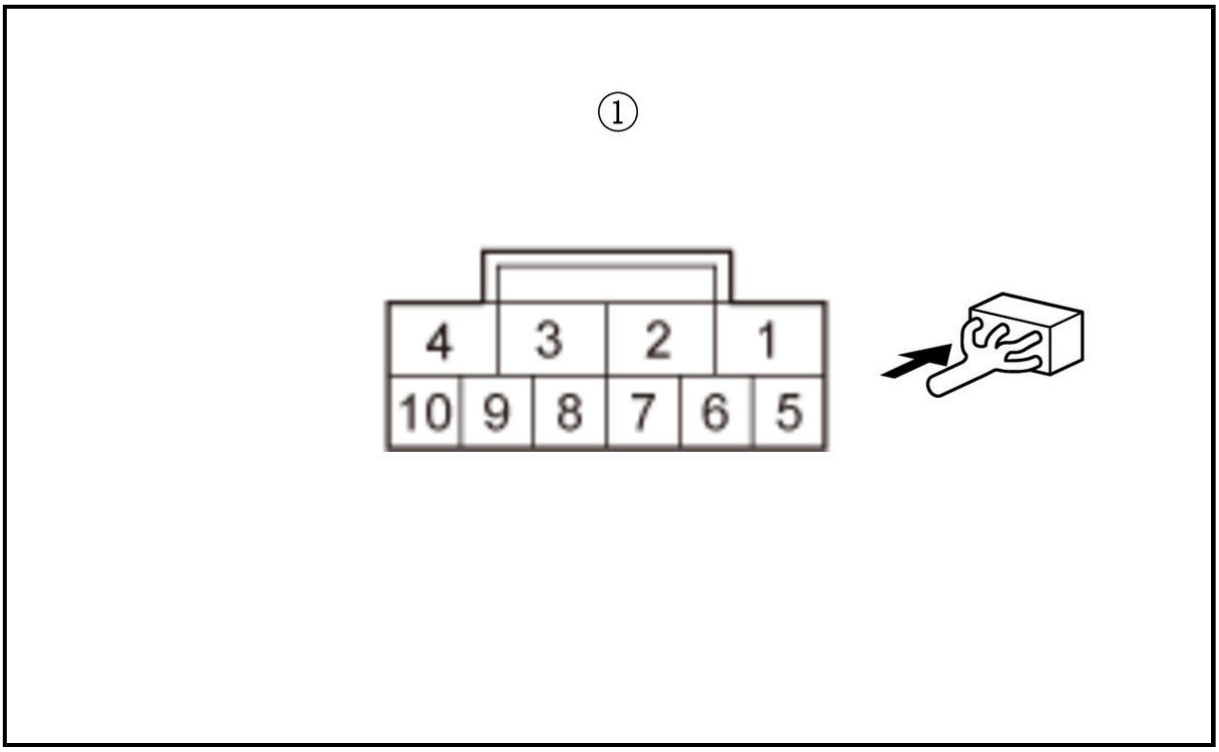
43. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Right rear door latch 10P connector: disconnected
Test point 1	Right rear door latch 10P connector (female terminals) No. 9: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Faulty right rear door lock knob switch; **replace the right rear door latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G502).

44. Open wire check (RR_R_SILCON_UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector C (28P) No. 16**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RR_R_SILCON_UNLOCK wire is OK. Faulty body control module; **replace the body control module** .

45. Keyless/power door locks/security system check

-1. With the driver's door closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Door Switch	B	B

Is information value ON?

YES

Go to step 46.

NO

Go to step 48.

46. Driver's door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

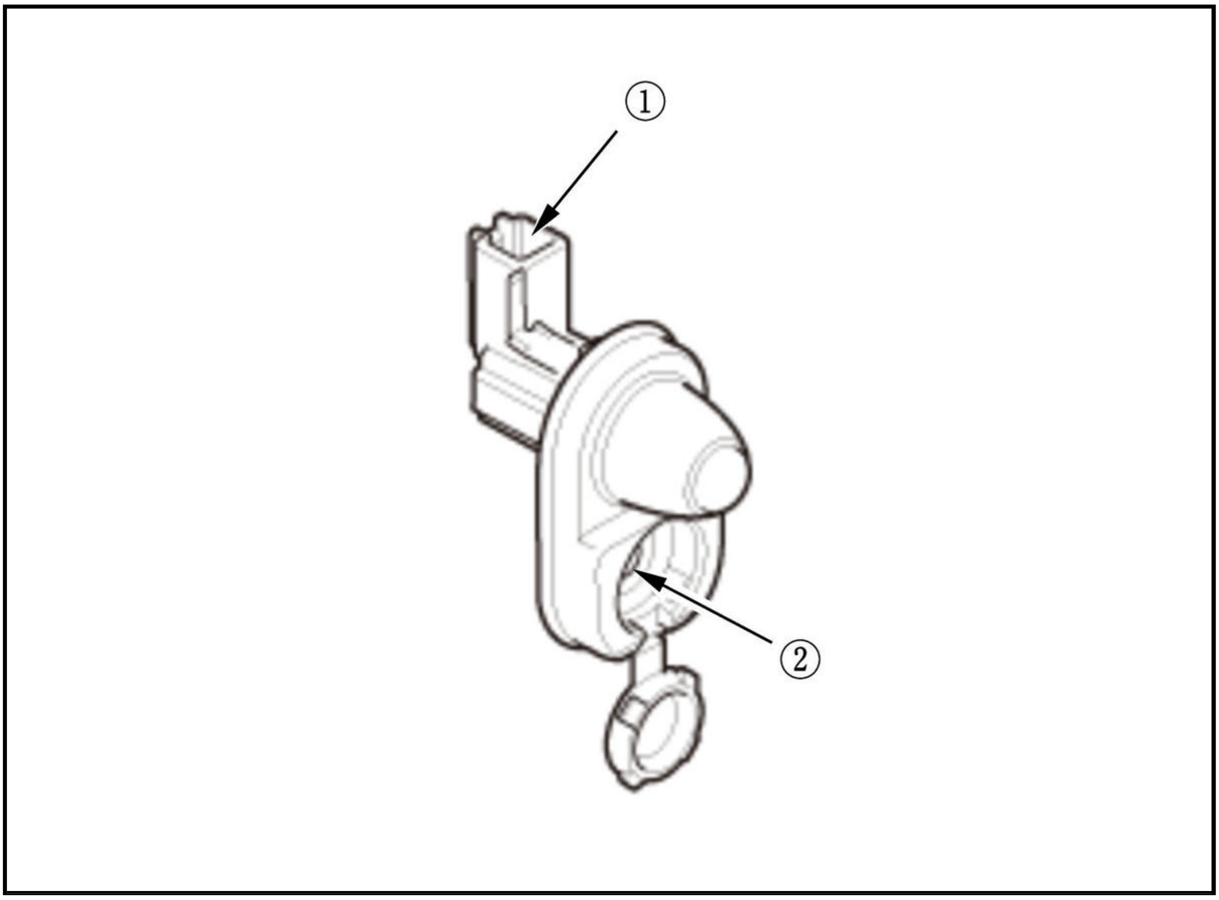
-2. Remove the driver's door switch.

-3. Disconnect the following connector.

Driver's door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Driver's door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 47.

NO

Replace the driver's door switch.

47. Shorted wire check (FL_DOOR_SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected Driver's door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The FL_DOOR_SW wire is OK. Faulty body control module; **replace the body control module** .

NO

Repair a short to ground in the wire.

48. Driver's door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

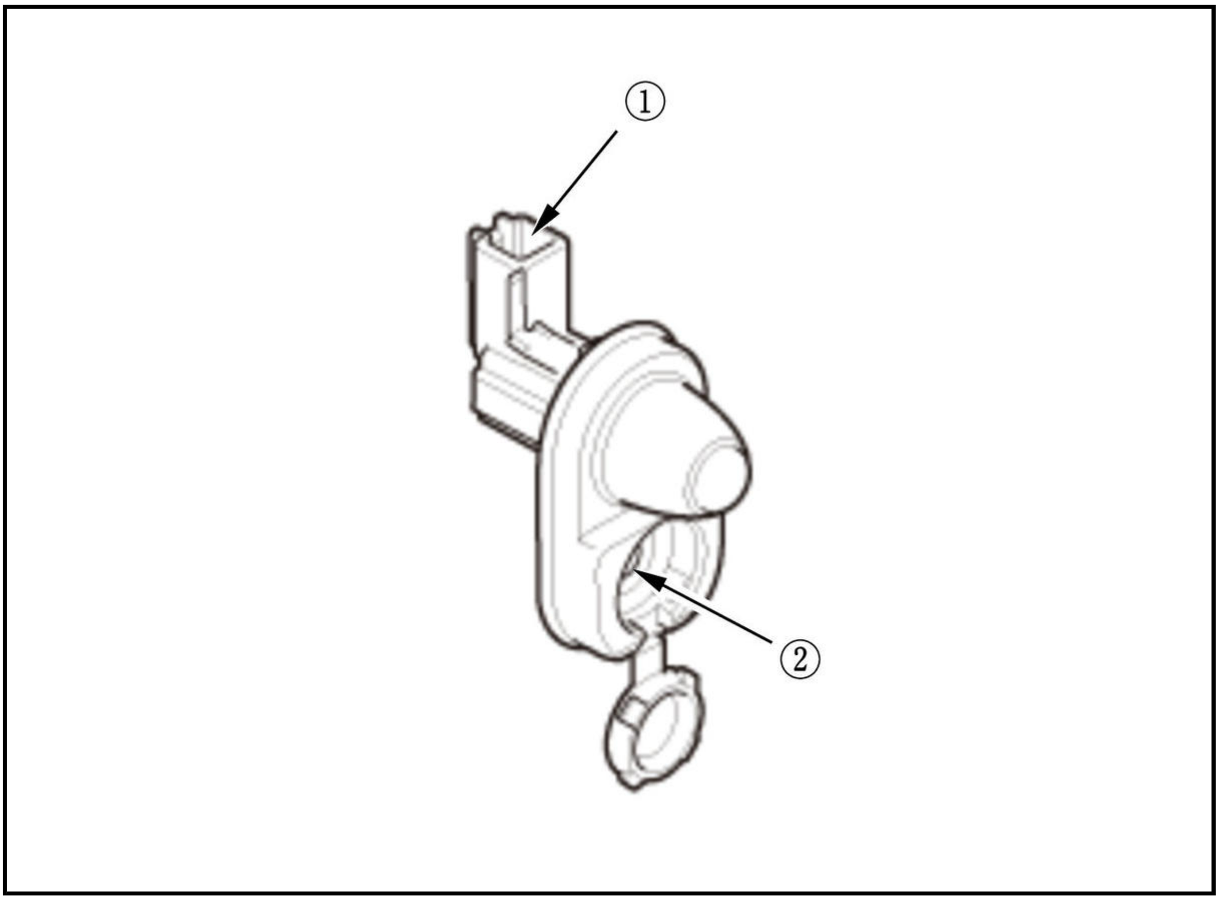
-2. Remove the driver's door switch.

-3. Disconnect the following connector.

Driver's door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Driver's door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 49.

NO

Replace the driver's door switch.

49. Open wire check (FL_DOOR_SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector D (40P) No. 22**
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Driver's Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The FL_DOOR_SW wire is OK. Faulty body control module; **replace the body control module** .

50. Keyless/power door locks/security system check

-1. With the front passenger's door closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Front Passenger's Door Switch	B	B

Is information value ON?

YES

Go to step 51.

NO

Go to step 53.

51. Front passenger's door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

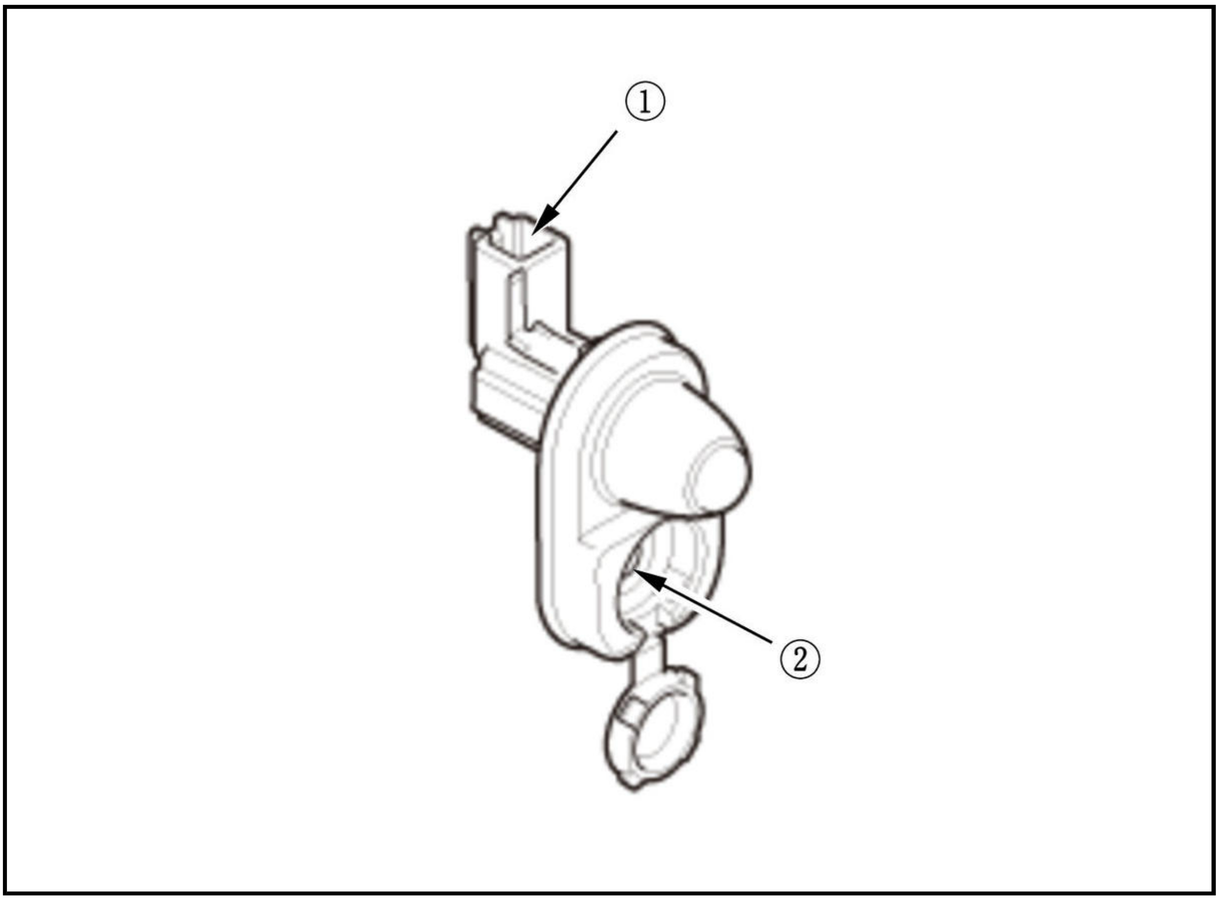
-2. Remove the front passenger's door switch.

-3. Disconnect the following connector.

Front passenger's door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Front passenger's door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 52.

NO

Replace the front passenger's door switch.

52. Shorted wire check (FR_DOOR_SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected Front passenger's door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 23**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The FR_DOOR_SW wire is OK. Faulty body control module; **replace the body control module** .

NO

Repair a short to ground in the wire.

53. Front passenger's door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

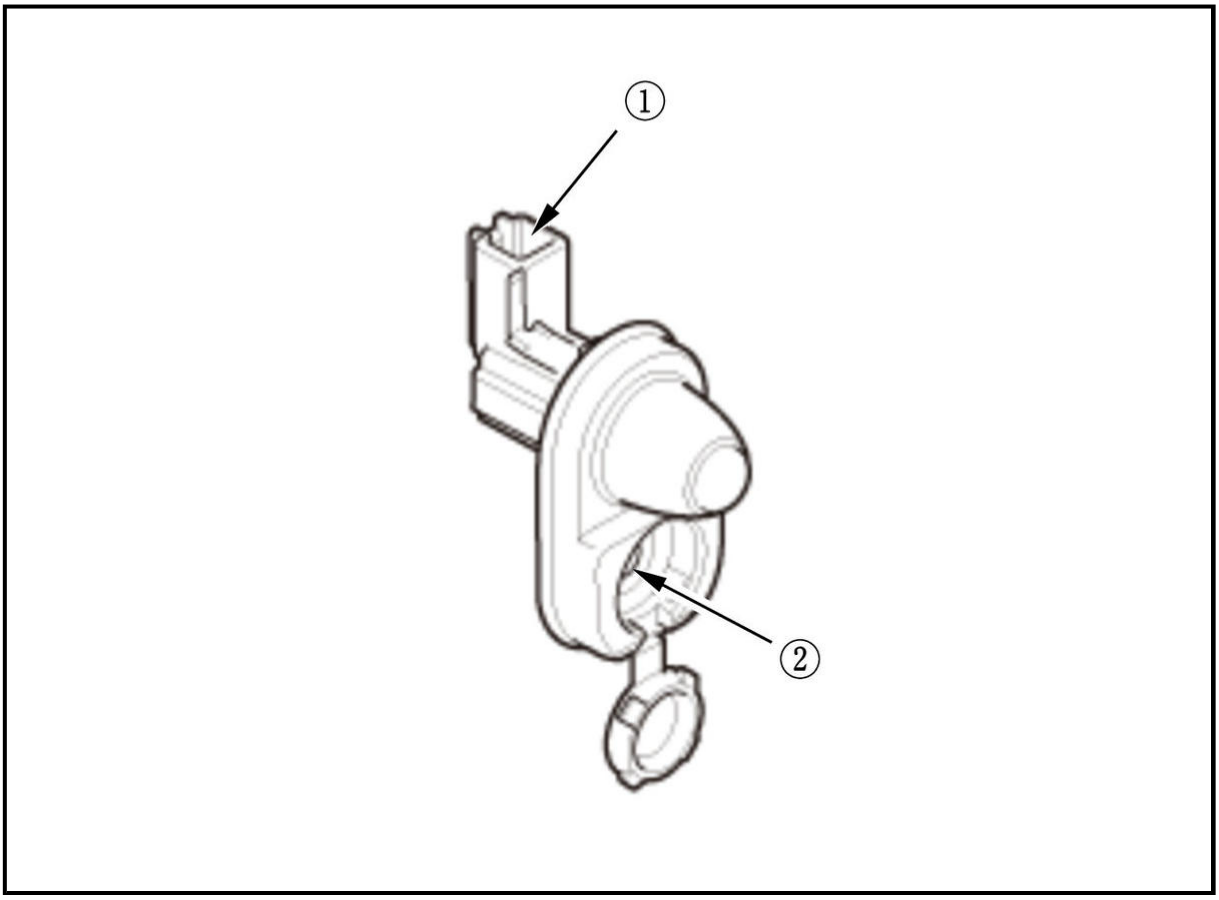
-2. Remove the front passenger's door switch.

-3. Disconnect the following connector.

Front passenger's door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Front passenger's door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 54.

NO

Replace the front passenger's door switch.

54. Open wire check (FR_DOOR_SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Body control module connector D (40P) No. 23
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Front Passenger's Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The FR_DOOR_SW wire is OK. Faulty body control module; replace the body control module .

55. Keyless/power door locks/security system check

-1. With the left rear door closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Switch	B	B

Is information value ON?

YES

Go to step 56.

NO

Go to step 58.

56. Left rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

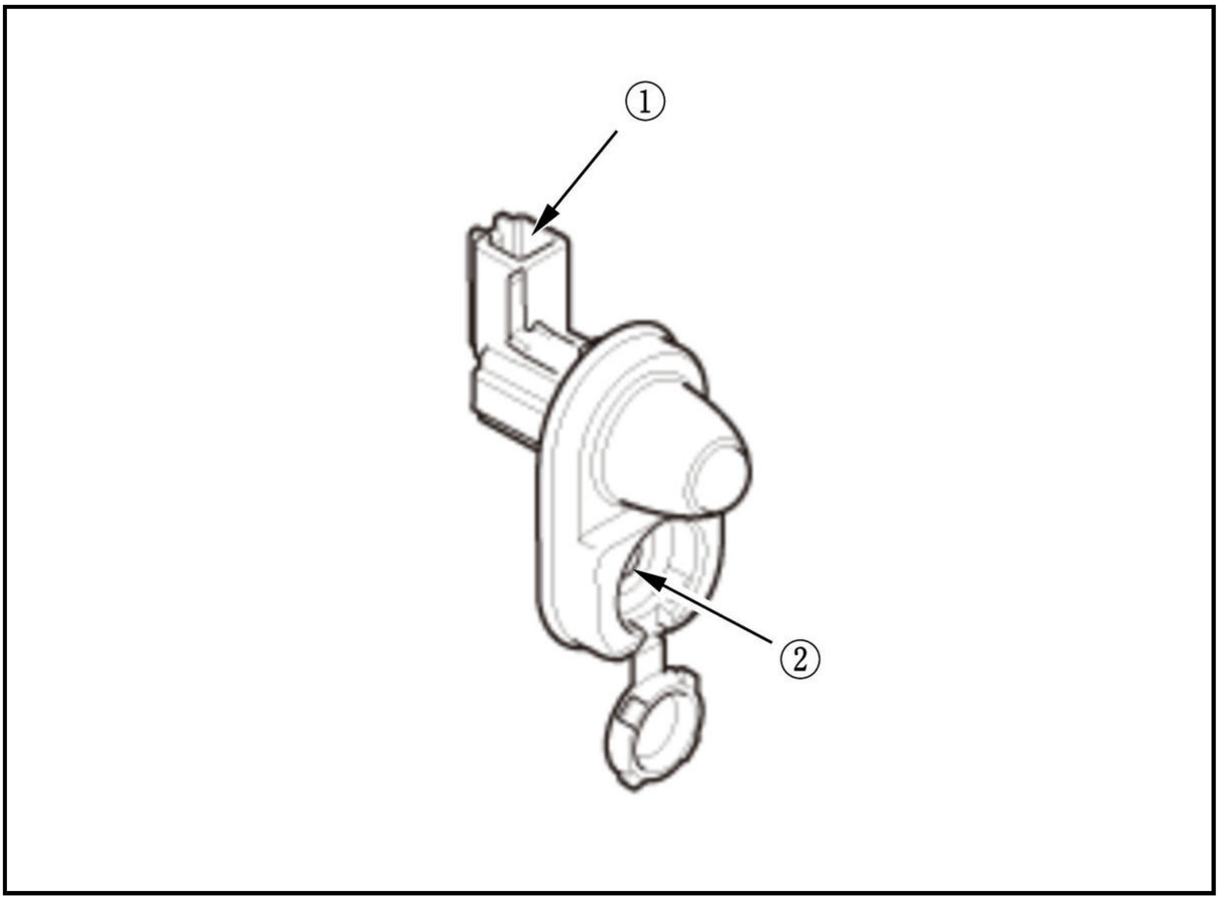
-2. Remove the left rear door switch.

-3. Disconnect the following connector.

Left rear door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Left rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 57.

NO

Replace the left rear door switch.

57. Shorted wire check (RL_DOOR_SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected Left rear door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 24**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RL_DOOR_SW wire is OK. Faulty body control module; **replace the body control module** .

NO

Repair a short to ground in the wire.

58. Left rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

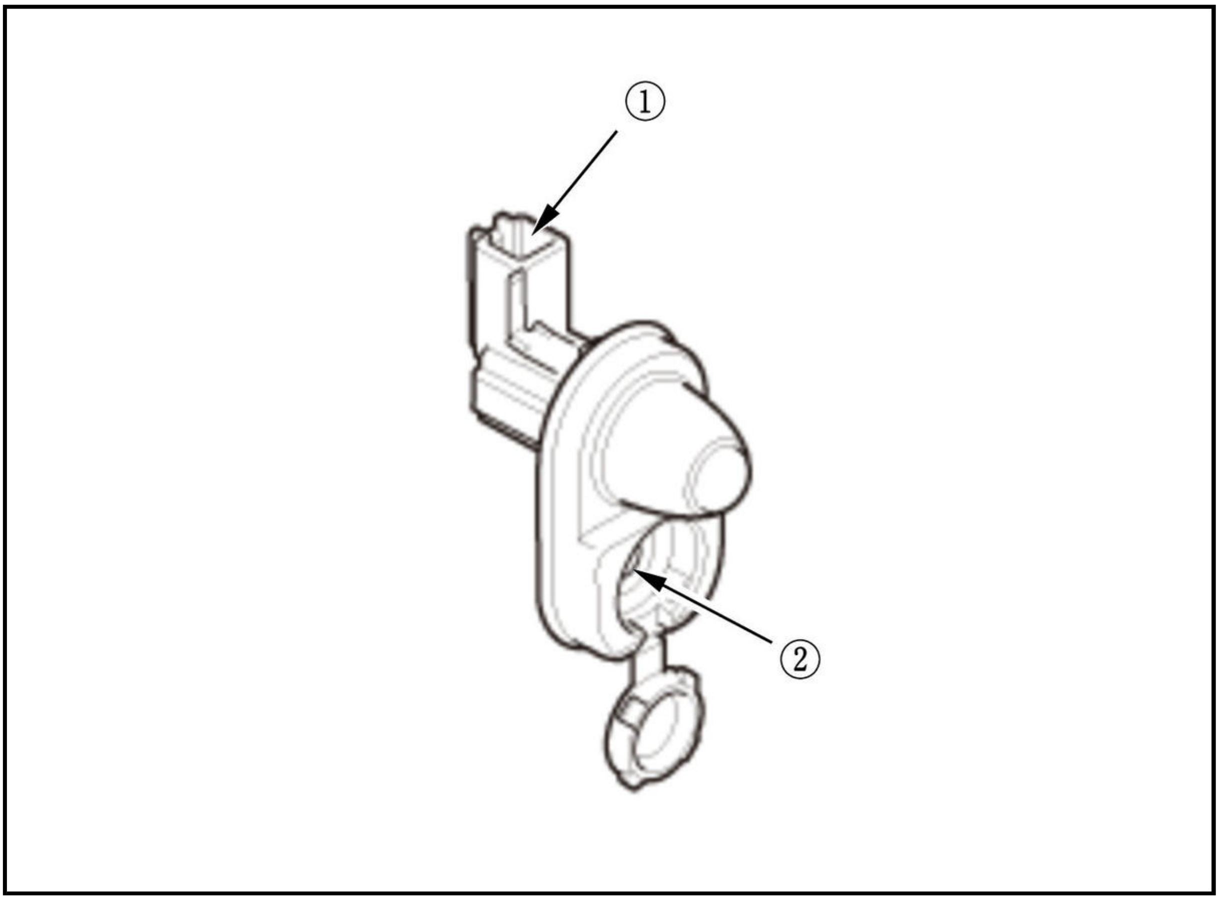
-2. Remove the left rear door switch.

-3. Disconnect the following connector.

Left rear door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Left rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 59.

NO

Replace the left rear door switch.

59. Open wire check (RL_DOOR_SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	Body control module connector D (40P) No. 24
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RL_DOOR_SW wire is OK. Faulty body control module; replace the body control module .

60. Keyless/power door locks/security system check

-1. With the right rear door closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Switch	B	B

Is information value ON?

YES

Go to step 61.

NO

Go to step 63.

61. Right rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

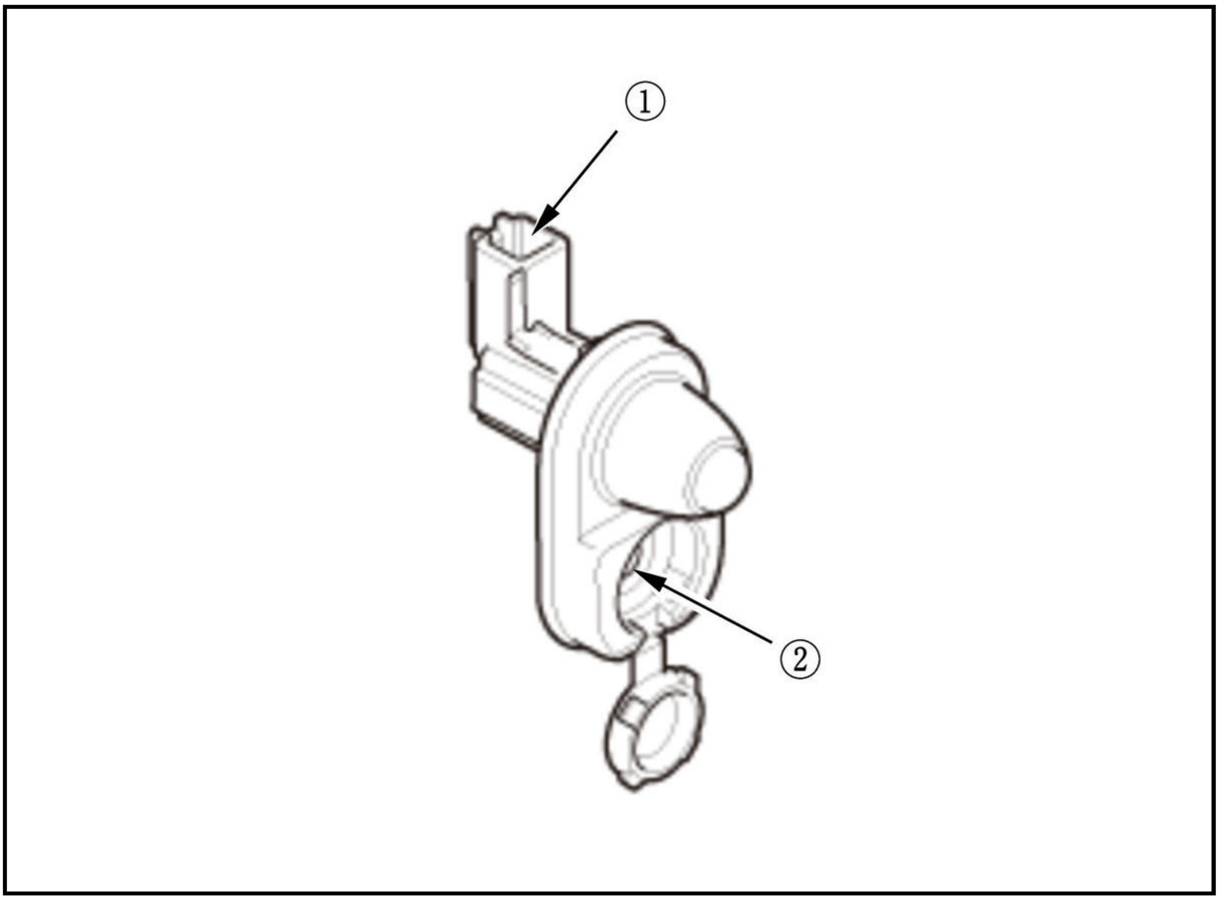
-2. Remove the right rear door switch.

-3. Disconnect the following connector.

Right rear door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Right rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 62.

NO

Replace the right rear door switch.

62. Shorted wire check (RR_DOOR_SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Body control module connector D (40P): disconnected Right rear door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 28**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The RR_DOOR_SW wire is OK. Faulty body control module; **replace the body control module** .

NO

Repair a short to ground in the wire.

63. Right rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

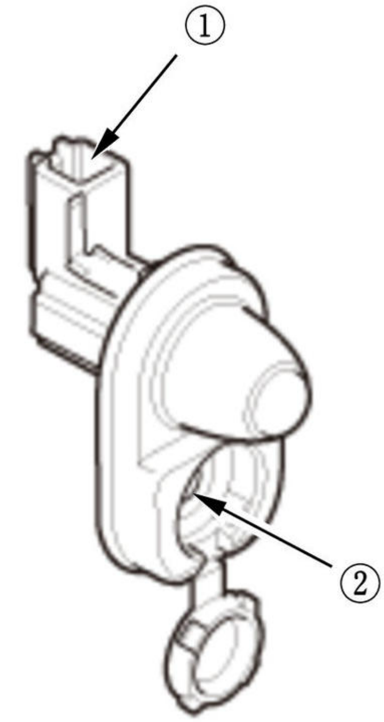
-2. Remove the right rear door switch.

-3. Disconnect the following connector.

Right rear door switch 1P connector

-4. Measure the resistance between test points 1 and 2.

Test point 1	Right rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there 1.0 MΩ or more when you press the switch and is there 1.0 Ω or less when you release the switch?

YES

Go to step 64.

NO

Replace the right rear door switch.

64. Open wire check (RR_DOOR_SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector D (40P) No. 28**
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Passenger's Rear Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RR_DOOR_SW wire is OK. Faulty body control module; **replace the body control module** .

65. Keyless/power door locks/security system check

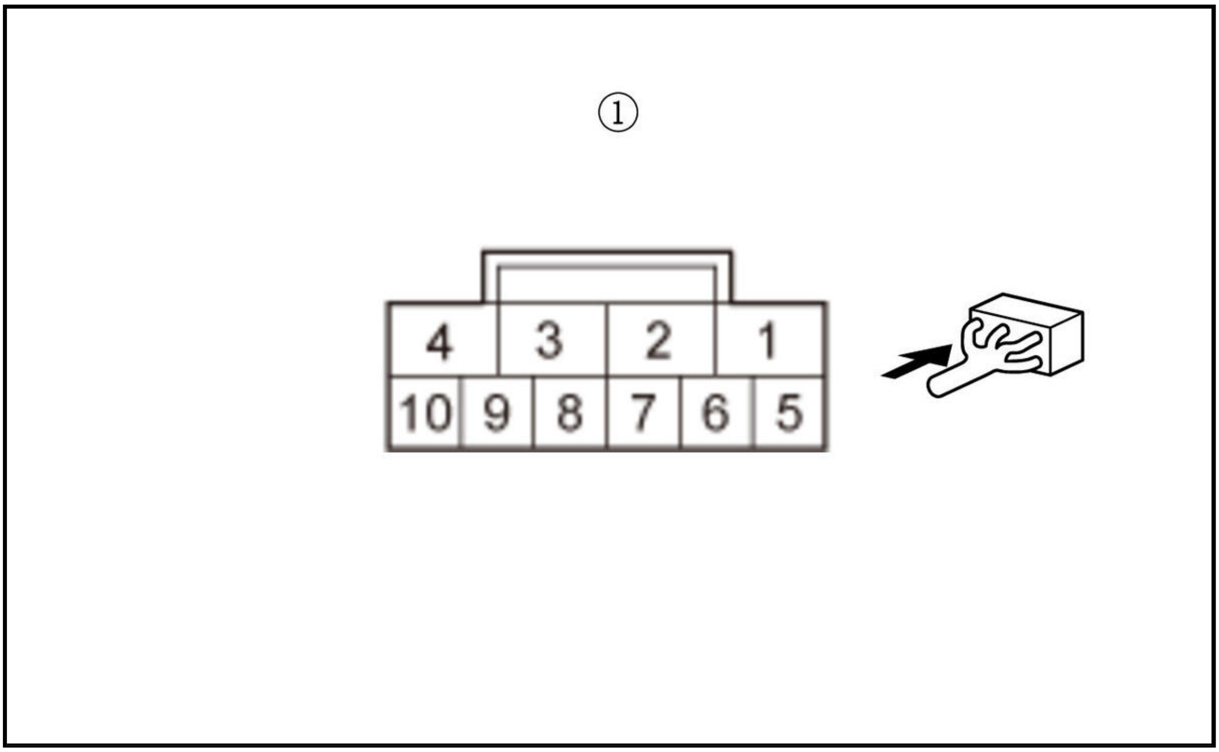
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door latch 10P connector (female terminals) No. 9: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Key Cylinder Switch(LOCK)	B	B

Is information value ON?

YES

Go to step 66.

NO

Go to step 68.

66. Driver's door key cylinder switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the driver's door key cylinder switch**.

Is the switch OK?

YES

Go to step 67.

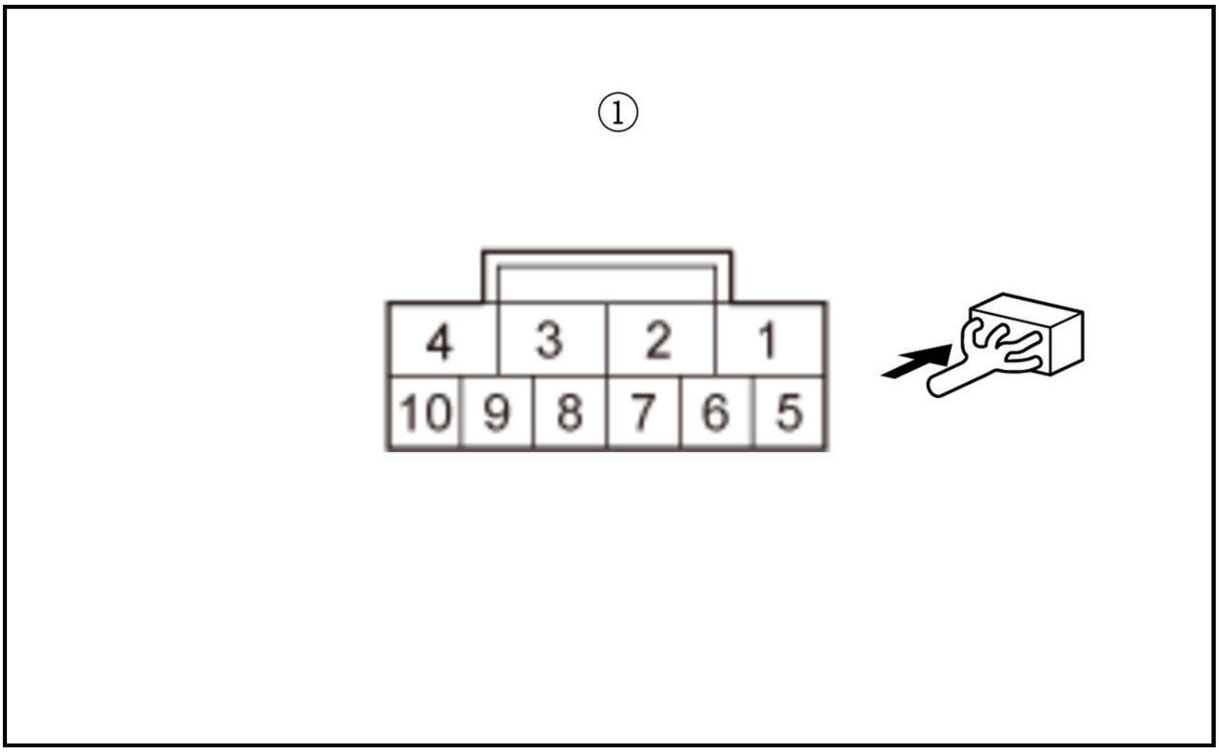
NO

Faulty driver's door key cylinder switch; **replace the driver's door latch** .

67. Open wire check (GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Driver's door latch 10P connector: disconnected
Test point 1	Driver's door latch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. **Replace the power window master switch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

68. Open wire check (DR_KEY_CYL_LOCK line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 7**
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Key Cylinder Switch(LOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The DR_KEY_CYL_LOCK wire is OK. **Replace the power window master switch** .

SERVICE PROCEDURE

KEYLESS ACCESS SYSTEM REGISTRATION

Procedure

NOTE: If the body control module or the park pawl actuator driver unit is replaced, the vehicle will not turn to the ON mode. Follow the registration procedure of the corresponding unit.

1. Keyless Access System - Register

   NOTE:

   - Check for aftermarket electrical equipment that could cause problems with keyless access operation.
   - While doing the registration, keep the remote away from computers.
   - Programming the remote also programs the keyless transmitter.
   - The body control module can store codes up to 6 remotes.
   - When each unit is replaced, such as updating and learning may be necessary in some cases, also make sure the removal and installation procedure of each unit.

   When Replacing the Body Control Module

   1. Connect the HDS to the data link connector

   2. Do the registration according to the "Immobilizer Setup Tool" screen.

   3. After registration, verify all remote related systems work normally with all remotes.

   When Replacing the PCM, the VSA Modulator-Control Unit, or Registration of the Remote(s)

   NOTE: If replacing the body control module, register the body control module first.

   1. Connect the HDS to the data link connector

   2. When all remotes are lost, select "Immobilizer Setup Tool", and turn the vehicle to ON mode according to the instructions on the HDS screen, then go to step 5.

   3. Turn the vehicle to the ON mode.

   4. Select "Immobilizer Setup Tool".

   5. Select the appropriate items, and do the registration according to the instructions on the HDS screen.

   6. After registration, verify systems work normally with all remotes. If the PCM is replaced, do the procedure after replacing PCM

   .

   When Replacing the Park Pawl Actuator Driver Unit

   1. Connect the HDS to the data link connector .

   2. Do the registration according to the "Immobilizer Setup Tool" screen.

   NOTE: Select "Replace Transmission Control Module"

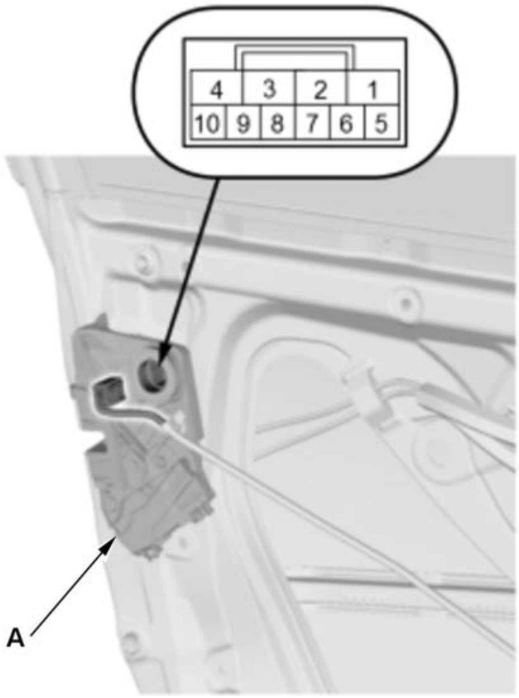
   3. After registration, verify all remote related systems work normally with all remotes.

TEST

DOOR KEY CYLINDER SWITCH TEST

Test

1. **Driver's Door Panel - Remove**
2. Door Key Cylinder Switch - Test



Position \ Terminal	7	9	10
LOCK	○	○	
NEUTRAL			
UNLOCK	○		○

1. Disconnect the connector.

2. Check for continuity between the terminals in each switch position according to the table.

3. If the continuity is not as specified, the door key cylinder switch is faulty; **replace the driver's door latch**

(A).

3. All Removed Parts - Install

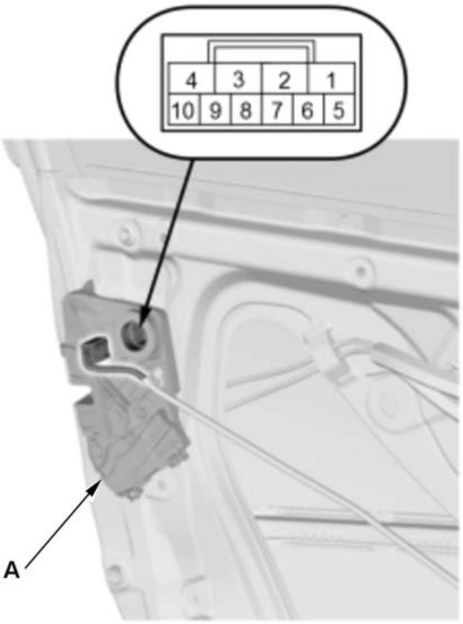
1. Install the parts in the reverse order of removal.

DOOR LOCK ACTUATOR TEST

Test

Front Door

1. **Front Door Panel - Remove**
2. Front Door Lock Actuator - Test



Driver's and Front Passenger's Door

Terminal / Operation	1	4
LOCK	⊖	⊕
UNLOCK	⊕	⊖

1. Disconnect the connector.

2. Check the actuator operation by connecting power and ground according to the table.

NOTE: To prevent damage to the actuator, apply battery voltage only momentarily.

3. If the actuator does not operate as specified, the front door lock actuator is faulty; **replace the front door latch**

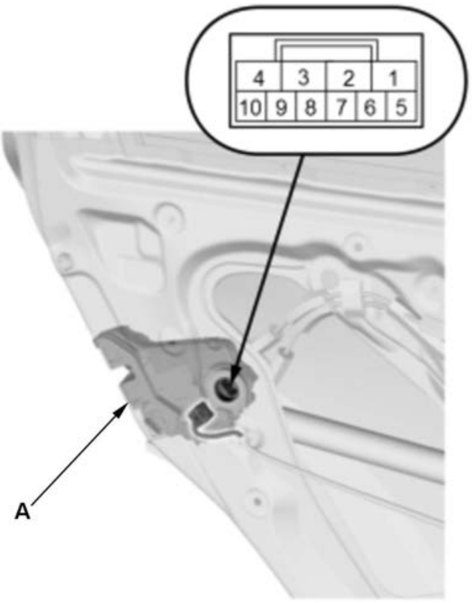
(A).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Rear Door

4. **Rear Door Panel - Remove**
5. Rear Door Lock Actuator - Test



Left and Right Rear Door

1. Disconnect the connector.

2. Check the actuator operation by connecting power and ground according to the table.

NOTE: To prevent damage to the actuator, apply battery voltage only momentarily.

3. If the actuator does not operate as specified, the rear door lock actuator is faulty; **replace the rear door latch**

(A).

Terminal / Operation	1	4
LOCK	⊖	⊕
UNLOCK	⊕	⊖

6. All Removed Parts - Install

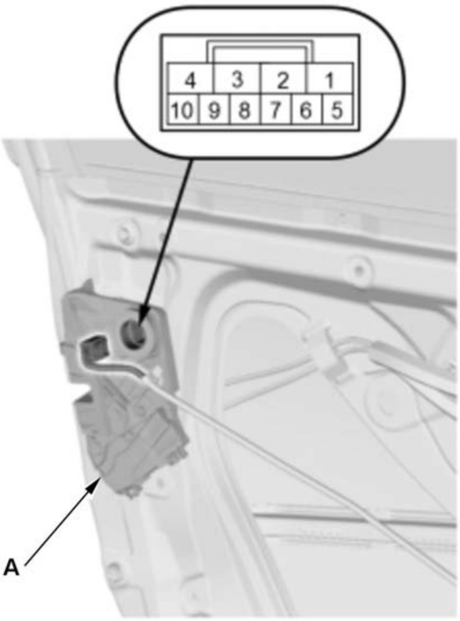
1. Install the parts in the reverse order of removal.

DOOR LOCK KNOB SWITCH TEST

Test

Front Door

1. Front Door Panel - Remove
2. Front Door Lock Knob Switch - Test



Driver's Door

Terminal / Position	5	6	7
LOCK		○	○
UNLOCK	○		○

Front Passenger's Door

Terminal / Position	8	10
LOCK		
UNLOCK	○	○

1. Disconnect the connector.

2. Check for continuity between the terminals in each switch position according to the table.

3. If the continuity is not as specified, the front door lock knob switch is faulty; replace the front door latch

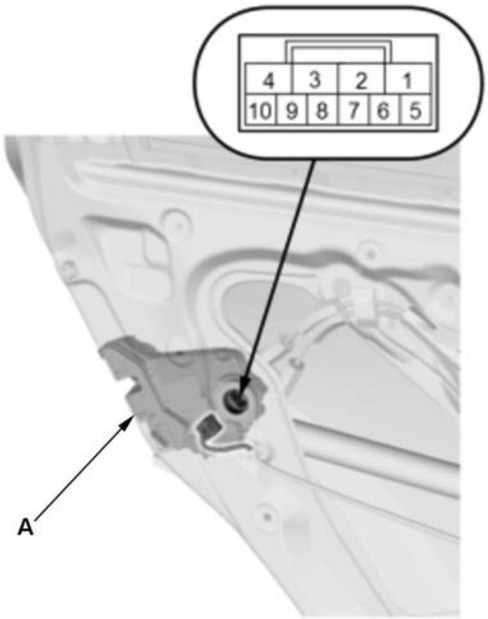
(A).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

Rear Door

4. **Rear Door Panel - Remove**
5. Rear Door Lock Knob Switch - Test



Left and Right Rear Door

Position \ Terminal	6	9
LOCK		
UNLOCK	○	○

1. Disconnect the connector.

2. Check for continuity between the terminals in each switch position according to the table.

3. If the continuity is not as specified, the rear door lock knob switch is faulty; **replace the rear door latch**

(A).

6. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

KEYLESS ACCESS LF ANTENNA FUNCTION TEST

NOTE: Before testing, check for DTCs. If any DTCs are indicated, troubleshoot the indicated DTCs first.

1. **Connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS.

4. Select the SELF CHECK and if any malfunction is found, troubleshoot it first. Select the FUNCTIONAL TESTS, and do the antenna driving test by checking the transmitting areas between the LF antenna and the keyless remote (inside of the vehicle; except on the dashboard, in the glove box, door pockets, console box, and other enclosed areas.).

Outside of the vehicle

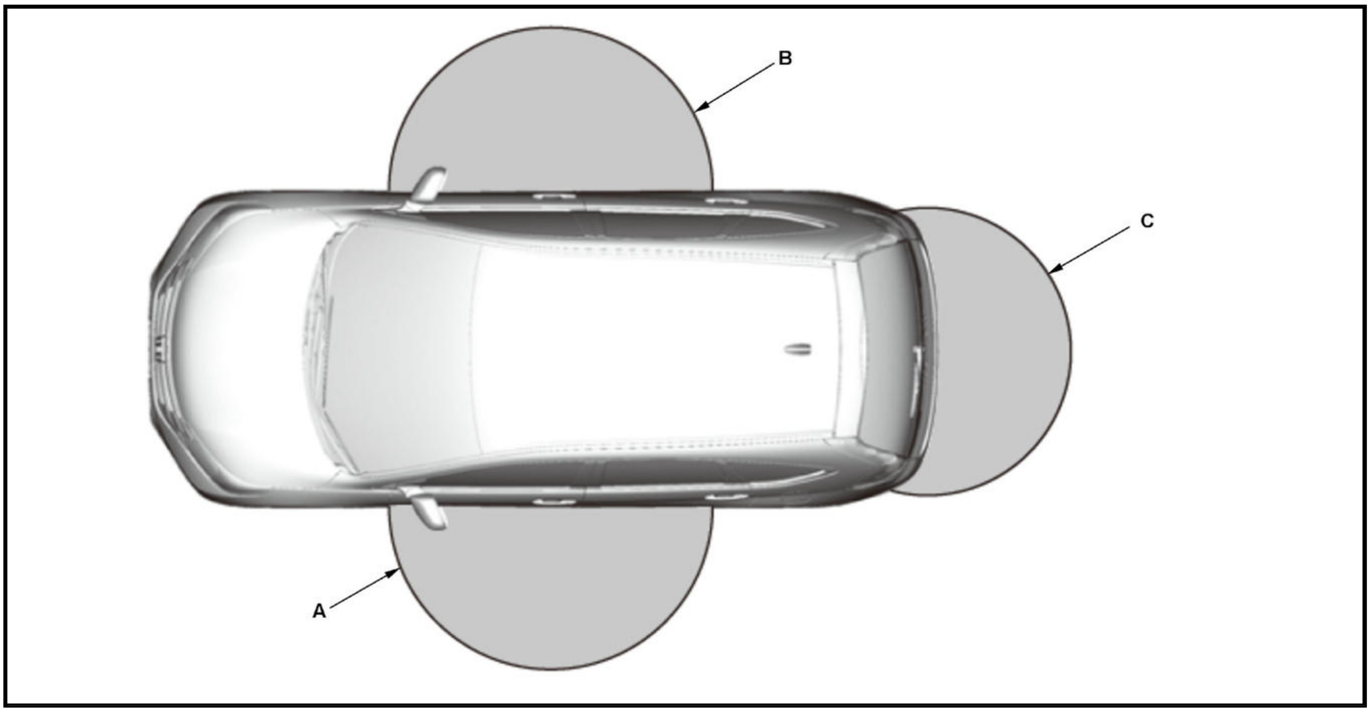
Transmitting Area	LF Antenna Location	HDS Indication (Functional Tests)
A	Driver's door LF Antenna	Driver (Door) Antenna Driving
B	Front passenger's door LF Antenna	Front Passenger (Door) Antenna Driving
C	Rear bumper LF Antenna	Trunk/Tailgate/Rear Bumper Antenna Driving

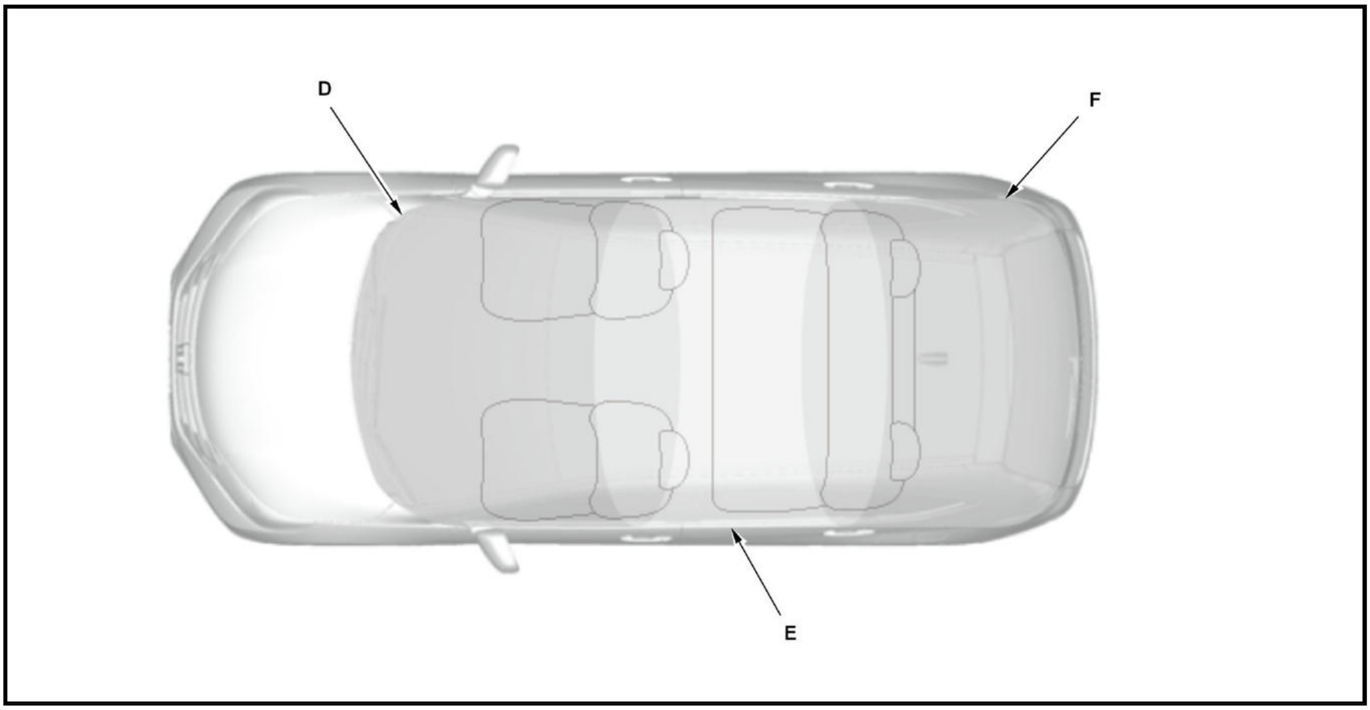
Inside of the vehicle

Transmitting Area	LF Antenna Location	HDS Indication (Functional Tests)
D	Front interior LF antenna	Front Interior Antenna Driving
E	Middle interior LF antenna	Middle Interior Antenna Driving
F	Rear interior LF antenna	Rear Interior Antenna Driving

NOTE:

- Functional Tests cannot operate at the same time, check the LF antennas one at a time.
- Outside of the vehicle; test the transmitting area at about 90 cm (35.4 in) height from the ground.
- The LED will blink when the keyless remote is within the shaded areas.





KEYLESS ACCESS SYSTEM STATUS LOG

If you suspect there is an immobilizer system problem, check the status log in the HDS.

1. Connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. On the HDS screen, at SYSTEM SELECTION MENU, enter ONE-PUSH START, then select KEYLESS ACCESS CONTROL UNIT or BACKUP CONTROL UNIT.

NOTE: If the HDS does not communicate, check the body control module power, ground, K-line, and L-line connectors.

4. At KEYLESS ACCESS CONTROL UNIT, enter KEYLESS ACCESS SYSTEM INFORMATION, then select KEYLESS ACCESS STATUS LOG.

5. At BACKUP CONTROL UNIT, enter SYSTEM INFORMATION, then select STATUS LOG. Check the STATUS LOG count. Troubleshoot the status with the highest count first. If no counts are listed, the immobilizer system is OK. Continue with normal symptom troubleshooting.

Status Log (Keyless Access Control Unit)

Status Log No.	Possible cause
B-1B-2	• PCM was not registered correctly • Body control module was registered correctly • Poor connections or loose terminals between body control module and PCM • Poor connections or loose terminals in the IG1 line • Low 12 volt battery voltage • Electrical noise
C-1C-2	• Poor connections or loose terminals in the IG1 line • Body control module was not registered • Low 12 volt battery voltage • Electrical noise
D-1D-2D-3	• Poor connections or loose terminals between body control module and PCM • Low 12 volt battery voltage • Electrical noise • Blown fuse

Status Log (Backup Control Unit)

Status Log No.	Possible cause
A-1A-2A-3	• Keyless remote was not registered correctly • Power switch failure
B-1B-2	• PCM was not registered correctly • Communication error between body control module and PCM • Low 12 volt battery voltage • Electrical noise
C-1C-2	• Body control module was not registered correctly

Status Log No.	Possible cause
	• Poor connections or loose terminals in the IG1 line • Low 12 volt battery voltage • Electrical noise

Status Log No.	Possible cause
D-1D-2D-3	• Poor connections or loose terminals between body control module and PCM • S-NET line short • Low 12 volt battery voltage • Electrical noise • Blown fuse

CHECK

KEYLESS ACCESS SYSTEM CHECK

1. Connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. On the HDS screen, at SYSTEM SELECTION MENU, enter ONE-PUSH START, then select KEYLESS ACCESS CONTROL UNIT or BACKUP CONTROL UNIT.

NOTE: If the HDS does not communicate, check the body control module power, ground, K-line, and L-line connectors.

4. At KEYLESS ACCESS CONTROL UNIT, enter KEYLESS ACCESS SYSTEM INFORMATION, then select SYSTEM CHECK 1 or SYSTEM CHECK 2.

5. At BACKUP CONTROL UNIT, enter SYSTEM INFORMATION, then select SYSTEM CHECK. If the HDS displays NORMAL N-1, the immobilizer system is OK at this time, refer to the STATUS LOG. If the HDS displays any other messages, check as follows:

System Check 1 (Keyless Access Control Unit)

System Check No.	Possible cause	Check items
A-1A-2A-3G-4	• Keyless remote is mismatched • No communication between body control module and keyless remote • Keyless remote is not registered	• Register the keyless remote • LF antenna test • Check antenna level with the HDS
B-1B-2G-1	• PCM is not registered • No communication between body control module and PCM • Body control module is replaced	• Register the PCM • Check PCM • Check for an open in the S-NET lines • Register the body control module
C-1C-2G-2G-3	• Body control module is not registered • Body control module is replaced	• Register the body control module • Check body control module • Check for an open in the S-NET lines
C-3C-4G-5	• Body control module is replaced • Communication error between body control module and park pawl actuator drive unit	• Register the body control module • Check for an open or short in the IGN_TRX line • Check park pawl actuator drive unit

System Check 2 (Keyless Access Control Unit)

System Check No.	Possible cause	Check items
D-1D-2D-3	• S-NET line is open or short • No communication between body control module and PCM	• Check for an open or short in the S-NET lines • Check body control module • Check PCM
D-4D-5	IGN_TRX line is open or short	Check for an open or short in the IGN_TRX line

System Check (Backup Control Unit)

System Check No.	Possible cause	Check items
A-1A-2A-3	• Keyless remote is mismatched	• Register the keyless remote

System Check No.	Possible cause	Check items
	- Keyless remote is not registered - Power switch failure	- Check power switch

System Check No.	Possible cause	Check items
B-1B-2	- PCM is replaced - Communication error between body control module and PCM	- Register the PCM - Check PCM
C-1C-2	Body control module is replaced	- Register the body control module - Check body control module - Check for an open in the S-NET lines
D-1D-2D-3	- S-NET line is open or short - No communication between body control module and PCM	- Check for an open or short in the S-NET lines - Check body control module - Check PCM
E-1E-2E-3E-4E-5	- Body control module is not registered - PCM is not registered - Keyless remote is not registered	- Register the body control module - Register the PCM - Register the keyless remote

TROUBLESHOOTING

KEYLESS ACCESS SYSTEM TOUCH SENSOR CIRCUIT TROUBLESHOOTING

1. Keyless access system check

-1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Select HISTORY CLEAR, and back to TEST MODE menu:

NOTE: When the freeze data is cleared, the information indicates "NOT CONFIRMED".

- DRIVER DOOR UNLOCK SWITCH
- DRIVER DOOR LOCK SWITCH
- FRONT PASSENGER DOOR UNLOCK SWITCH
- FRONT PASSENGER DOOR LOCK SWITCH

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Get out of the vehicle with the keyless remote, and touch the each door outer handle touch sensors.

-5. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Recheck HISTORY DATA.

- DRIVER DOOR UNLOCK SWITCH
- DRIVER DOOR LOCK SWITCH
- FRONT PASSENGER DOOR UNLOCK SWITCH
- FRONT PASSENGER DOOR LOCK SWITCH

Is all the information OK?

YES

Intermittent failure, the system is OK at this time.

NO

Go to step 2.

2. Open wire check (GND line)

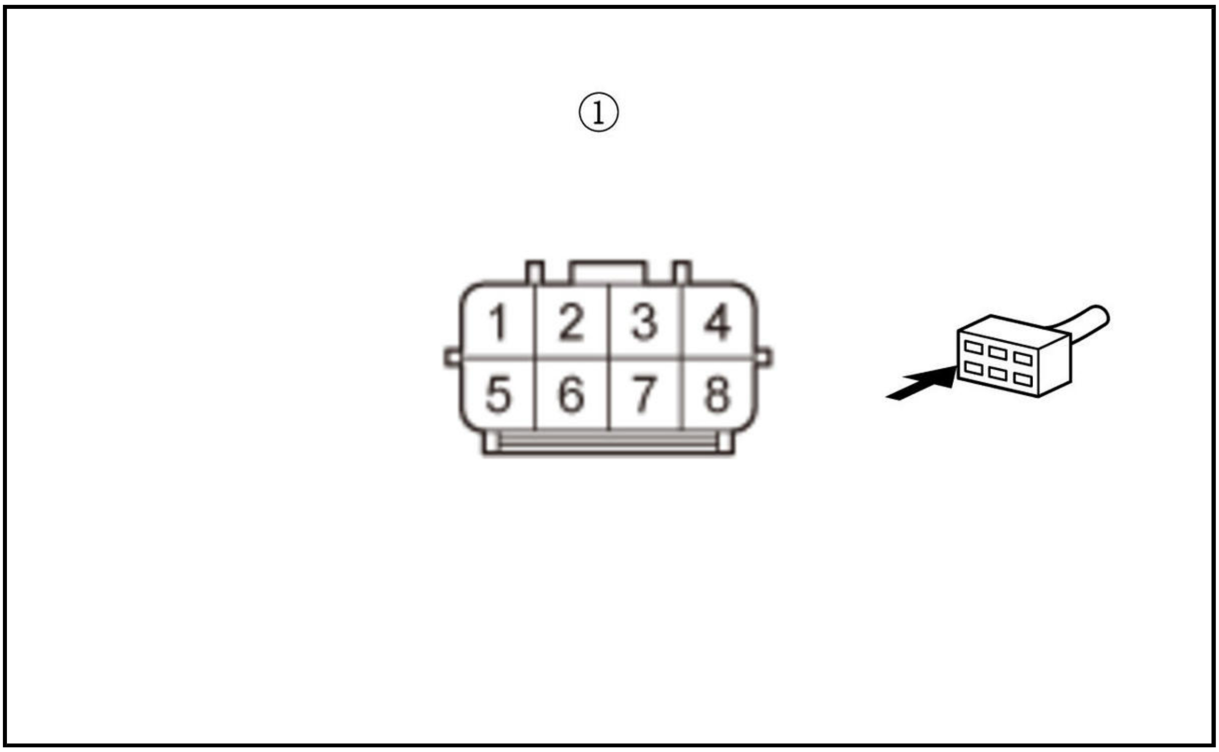
-1. Disconnect the following connectors.

Each door outer handle 8P connectors

-2. Measure the resistance between test points 1 and 2 individually.

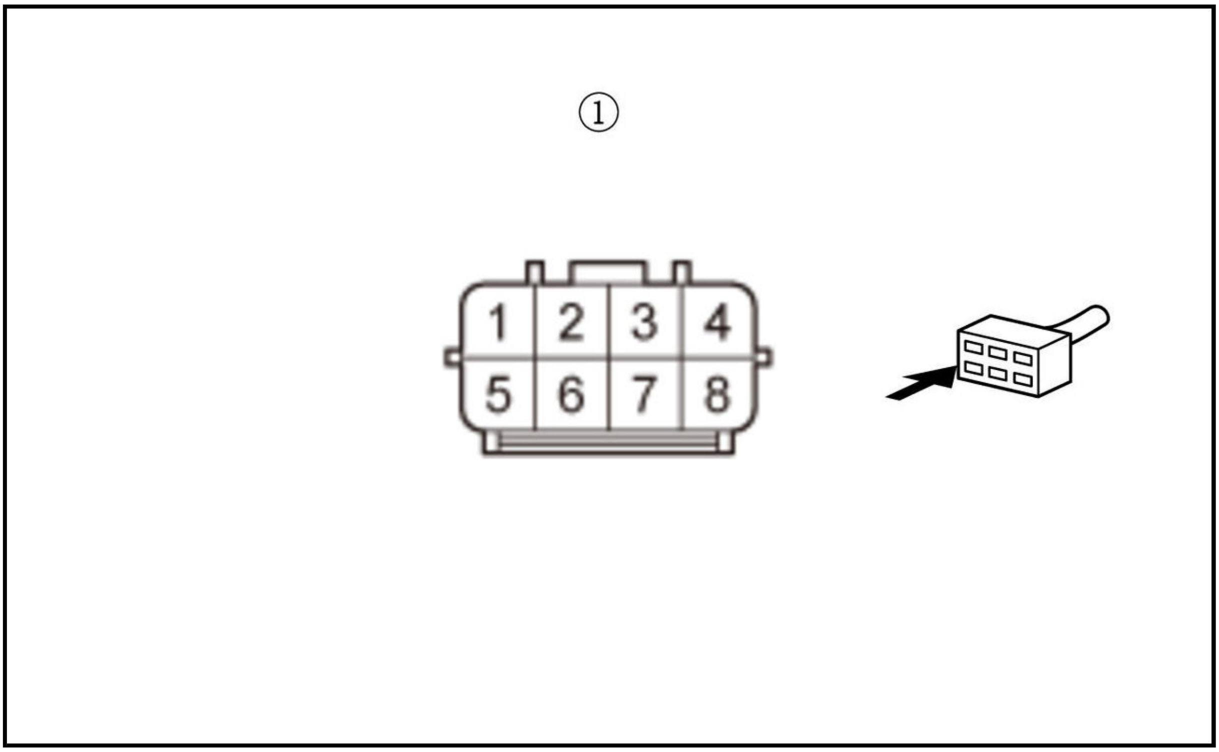
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 8: ①
Test point 2	Body ground



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wires are OK. Go to step 3.

NO

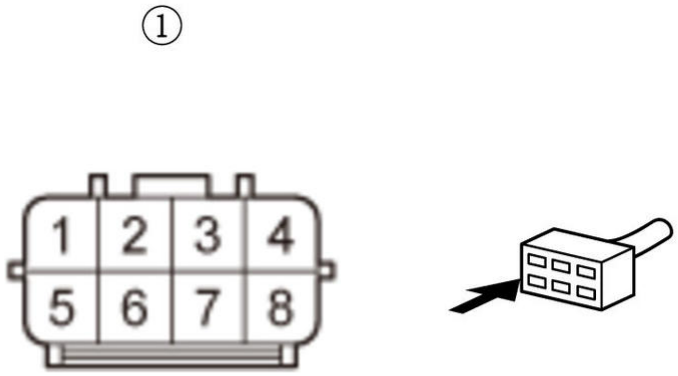
Repair an open or high resistance in the ground wire or poor ground (G401, G402).

3. Determine possible failure area (TS lines, DL lines, VOUT lines)

-1. Measure the voltage between test points 1 and 2 individually.

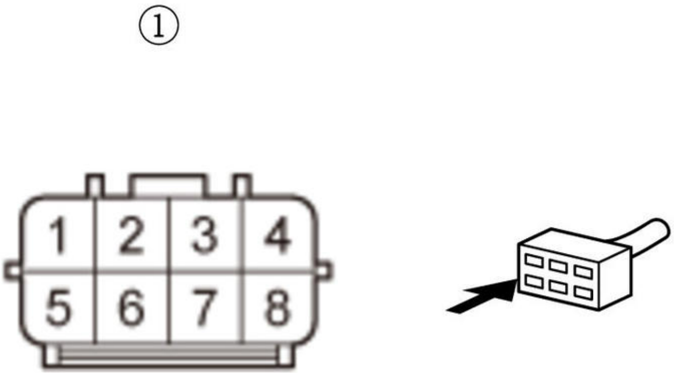
Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Open wire check (TS lines, DL lines)

-1. Disconnect the following connector.

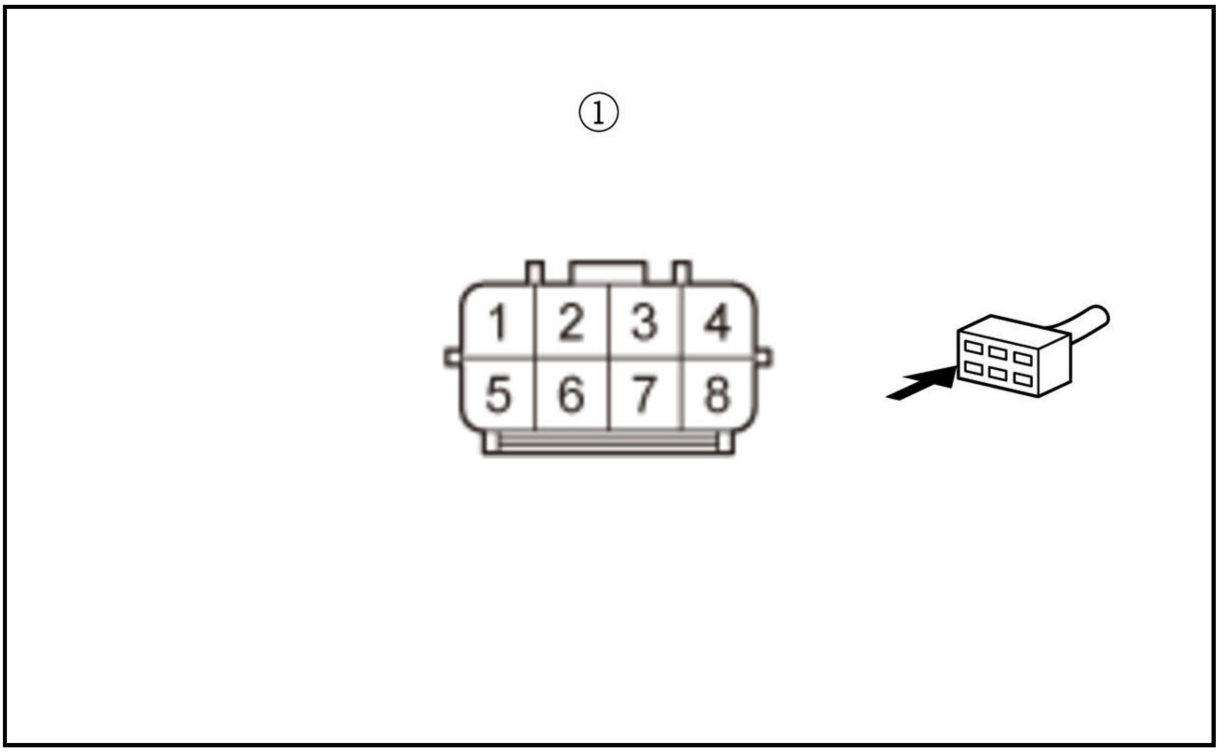
Body control module connector G (32P)

-2. Measure the resistance between test points 1 and 2 individually.

Driver's door

Test condition	Vehicle OFF (LOCK) mode Driver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 3: ①
Test point 2	**Body control module connector G (32P) No. 22**

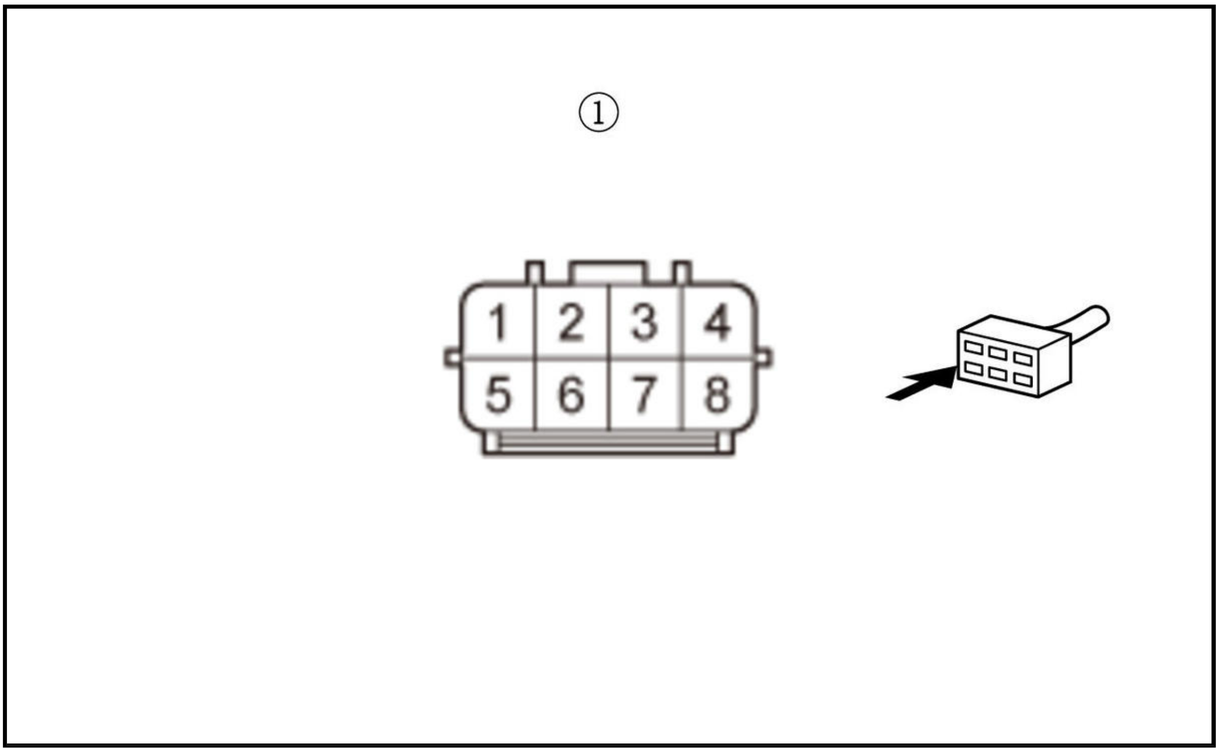
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 7: ①
Test point 2	**Body control module connector G (32P) No. 19**



Front passenger's door

Test condition	Vehicle OFF (LOCK) mode Front passenger's door outer handle 8P connector: disconnected
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 3: ①
Test point 2	**Body control module connector G (32P) No. 25**

Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 7: ①
Test point 2	**Body control module connector G (32P) No. 1**



Is there 1.0 Ω or less?

YES

The TS and DL wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (TS lines, DL lines)

-1. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode Each door outer handle 8P connectors: disconnected Body control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 22**
Test point 2	Body ground

Test point 1	**Body control module connector G (32P) No. 19**
Test point 2	Body ground

Test point 1	**Body control module connector G (32P) No. 25**
Test point 2	Body ground

Test point 1	**Body control module connector G (32P) No. 1**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The TS and DL wires are OK. Go to step 6.

NO

Repair a short to ground in the wire.

6. Door outer handle touch sensor check (substitution)

-1. **Substitute a known-good door outer handle touch sensors** , and recheck.

Is the system OK?

YES

Faulty the original door outer handle touch sensor; **replace the door outer handle** .

NO

Replace the body control module .

7. Open wire check (VOUT lines)

-1. Measure the voltage between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode Each door outer handle 8P connectors: disconnected
Test point 1	**Body control module connector G (32P) No. 31**

Test point 2	Body ground

Test point 1	**Body control module connector G (32P) No. 30**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

The VOUT wires are OK. **Replace the body control module** .

KEYLESS BUZZER CIRCUIT TROUBLESHOOTING

1. Open wire check (GND line)

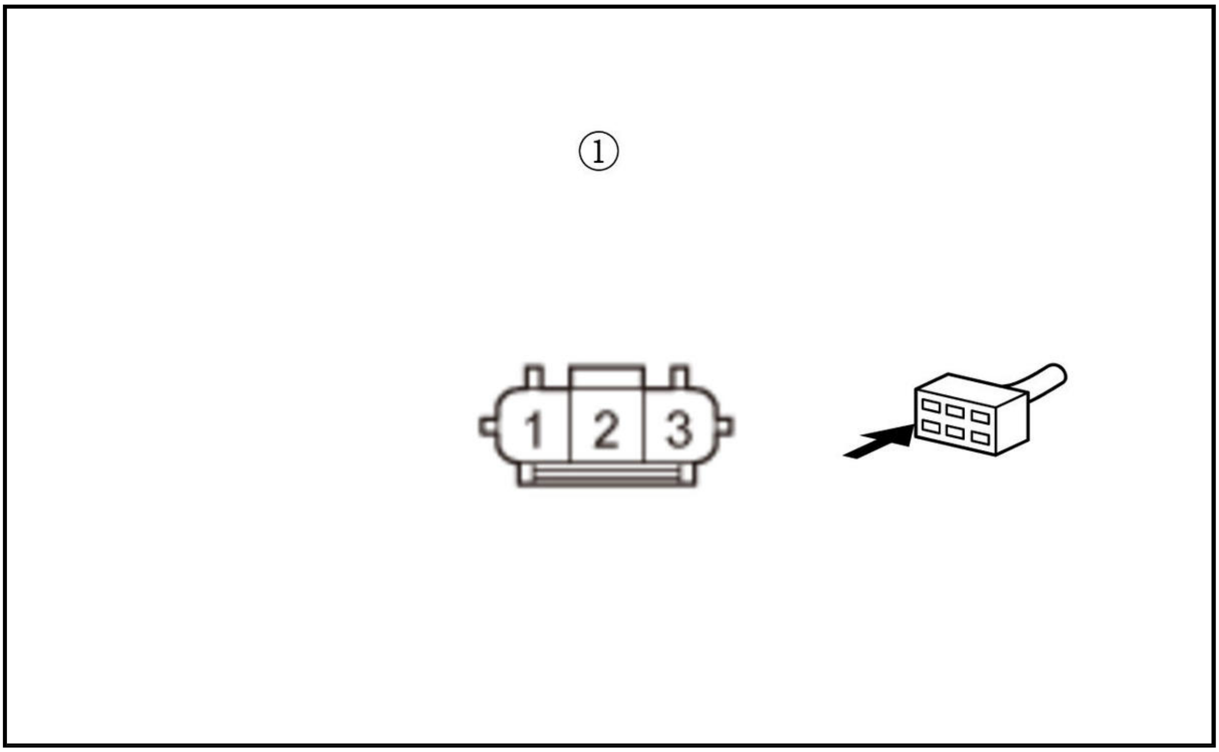
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Keyless buzzer 3P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Keyless buzzer 3P connector: disconnected
Test point 1	Keyless buzzer 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Go to step 2.

NO

Repair an open or high resistance in the ground wire or poor ground (G505).

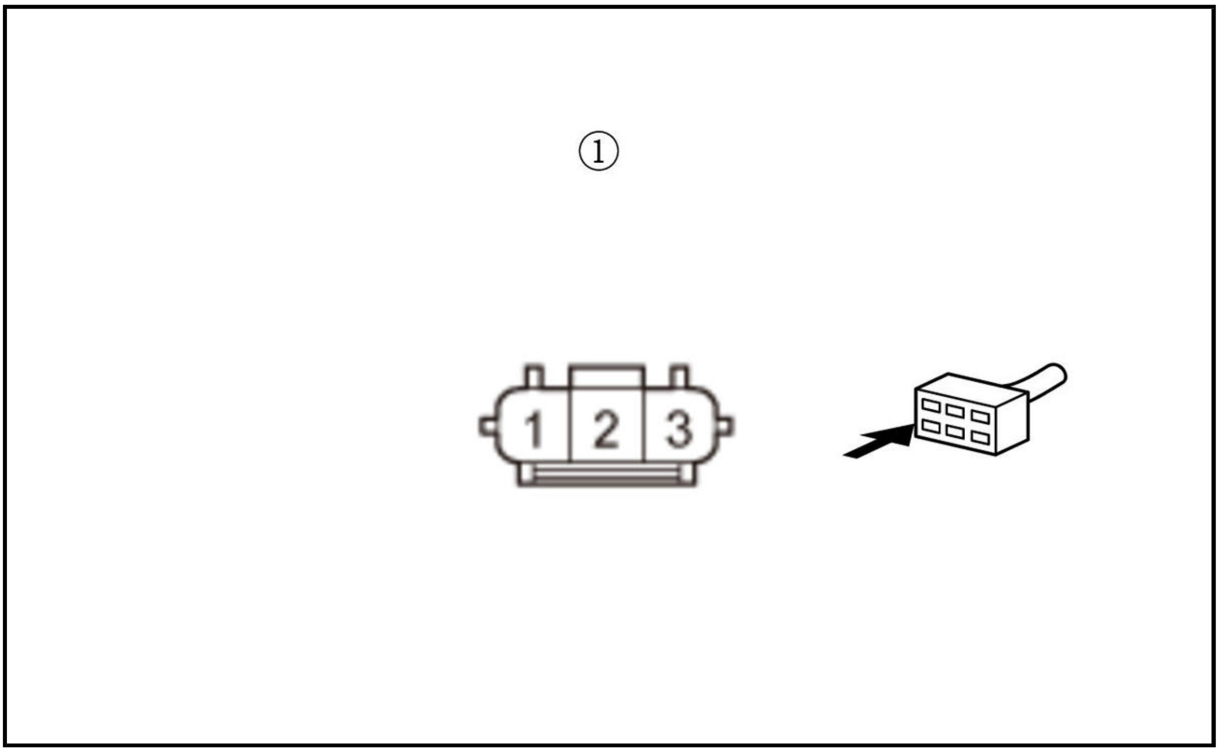
2. Open wire check (SMART_BUZZER line)

-1. Disconnect the following connector.

Body control module connector E (24P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Keyless buzzer 3P connector: disconnected Body control module connector E (24P): disconnected
Test point 1	**Body control module connector E (24P) No. 22**
Test point 2	Keyless buzzer 3P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

The SMART_BUZZER wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (SMART_BUZZER line)

-1. Remove the jumper wire from the keyless buzzer 3P connector.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode Keyless buzzer 3P connector: disconnected Body control module connector E (24P): disconnected
Test point 1	**Body control module connector E (24P) No. 22**
Test point 2	Body ground

Is there 1.0 MΩ or more?

YES

The SMART_BUZZER wire is OK. Go to step 4.

NO

Repair a short to ground in the wire.

4. Keyless buzzer check (substitution)

-1. **Substitute a known-good keyless buzzer** .

-2. Check the keyless buzzer function.

Does the keyless buzzer sound?

YES

Replace the original keyless buzzer .

NO

Replace the body control module .

Security System / Keyless Entry System - Testing & Troubleshooting (Except Hybrid) - CR-V

DESCRIPTION AND OPERATION

IMMOBILIZER SYSTEM

Immobilizer System Description

Immobilizer Function

An immobilizer system adds a second electronic layer of security to the vehicle. If the key matches mechanically, but the electronic check does not match, the PCM suspends fuel delivery and shuts down the engine. For models with keyless access, refer to the keyless access description as the immobilizer function is integrated into the remotes.

The system provides mutual authentication between the immobilizer-keyless control unit, the PCM, and the body control module when turning the vehicle to the ON mode. The engine stays running after the engine start-up if the correct key is inserted. The body control module authenticates the VSA modulator-control unit and the immobilizer signal only one time by request of the immobilizer-keyless control unit, when the vehicle is turned to the ON mode after resetting of the battery, removal and installation of the back-up fuse, or removal and installation of the VSA modulator-control unit.For some models, the brake pedal must be depressed to perform the immobilizer authentication.

Immobilizer System Description - Components

Security Indicator

When vehicle ON mode is entered, the authentication of the immobilizer key starts and the indicator is off. When the key is successfully authenticated, the indicator stays off. When the key is not successfully authenticated, the indicator blinks, the vehicle is turned to the OFF (LOCK) mode, and then the indicator goes off after blinking several times. For details on the illumination pattern, refer to **immobilizer system symptom troubleshooting information**.

Ignition Key

Vehicles equipped with the immobilizer system have an identification marking on the mechanical key. Consider this identification marking as a proof of the vehicle having the immobilizer system.

KEYLESS ACCESS SYSTEM

Keyless Access System Description

Smart Entry Function

The body control module detects the input signal of the door outer handle touch sensor, the outer handle lock sensor, or the tailgate outer handle switch, the tailgate lock switch, and authenticates 2-way communication with the remote. The body control module then activates the door lock/unlock actuator or tailgate release actuator and an answer back. For details on the illumination patterns of the warning lights and the functional check of the system, refer to keyless access system symptom troubleshooting information.

Keyless Entry Function

The body control module receives the keyless transmitter LOCK/UNLOCK signals from the remote. The body control module authenticates the RF signal from the remote, then activates the door and tailgate release actuator (without power tailgate), and the power tailgate control unit (with power tailgate) via B-CAN.

Lighting and Indicator Function

The body control module controls the engine start/stop switch light, displays information on the information display *1 or the multi-information display (MID) *2, and illuminates the keyless access indicators in the gauge control module.

*1: Without multi-information display (MID)

*2: With multi-information display (MID)

Remote Search Function

The function determines if the remote is present inside the vehicle during certain operations or functions. It also detects when the door is opened and closed with the vehicle in the ACCESSORY/ON mode. When the remote is taken out of the vehicle, the keyless buzzer will sound and the gauge control module (Only when the vehicle is in the ON mode) will show a warning.

Backup Communication Function

When key authentication between the remote and the body control module is not possible because of a system abnormality or a drop of the battery voltage of the remote, the immobilizer function can be canceled by pressing the engine start/stop switch once and bringing the remote close to the engine start/stop switch while the light (white) of the engine start/stop switch is flashing. This causes the immobilizer signal to be sent to the body control module via the LF antenna of the engine start/stop switch.

Remote Engine Start System (With Remote Engine Start)

Start the Engine

The remote engine start feature is initiated by first pressing the lock button, then pressing and holding the "START" button within 5 seconds on the remote transmitter. An RF signal from the remote transmitter is received by the body control module, which then sends the request to start the engine to the PCM. At the same time, the body control module authenticates the key for the immobilizer system. The PCM starts the engine and sends feedback to the body control module indicating the status of the engine.

Key Lockout Prevent Function

The lockout prevent function monitors whether or not there is a remote in the vehicle. If the remote is inside the vehicle, the system will not lock the doors. If the driver manually locks and closes the doors with the remote in the vehicle, the body control module energizes the driver's door lock actuator and unlocks the driver's door. Additionally, if the tailgate is closed with the remote left in the rear cargo area, the external RF unit detects its location and does not lock the tailgate.

Alarm Function

Detects if the doors are opened or closed with the vehicle in the ACCESSORY/ON mode. When the remote is taken out of the vehicle, the keyless buzzer will sound and the gauge control module (during vehicle ON mode) will show a warning. Before the remote battery level falls to the point where the remote cannot be detected, the gauge control module will show a warning and an alarm will sound.

Registration Facility

The body control module can store up to 6 remotes with the HDS.

Fault Diagnosis Function

The system has a fault diagnosis function. If any malfunction occurs, the keyless access indicator comes on in the gauge control module.

Customer Emergency

When the engine start/stop switch is pressed continuously at least twice or once for 1.5 seconds or longer in an emergency while driving, the engine turns off, and the vehicle mode switches to ACCESSORY. In this mode, the steering wheel remains unlocked.

Panic Function

When you press the PANIC button on the remote, the body control module sounds the horn, and activates the exterior lights.

Walk Away Auto Lock Function (If Equipped)

The walk away auto lock system detects where the remote is and locks all doors and the tailgate when all the doors and the tailgate are closed and the remote is outside of the vehicle and out of the range. To operate the walk away auto lock system, it is necessary to enter the auto lock mode. To enter the auto lock mode, the following conditions must be met:

- The vehicle is turned to the OFF (LOCK) mode.
- All doors including the tailgate are closed.
- The remote is outside but within 2 m (6 ft) from the vehicle.

Once the system enters the auto lock mode, the keyless beeper sounds once. When the remote is carried beyond 2 m (6 ft) from the vehicle and remains outside of this range for more than 2 seconds, the system engages and locks all of the doors including the tailgate. At that time, the keyless buzzer sounds and some exterior lights will flash. However, if the remote remains within 2 m (6 ft) from the vehicle for 30 seconds or more after entering the auto lock mode, the doors and tailgate will automatically lock.

The system does not work under the following conditions:

- The remote is inside of the vehicle.
- If the remote is away more than 2 m (6 ft) from the vehicle after closing all the doors and tailgate.
- If a communication error occurs between the remote and the vehicle.

The following conditions will cause a delay for the system to engage:

- If a door or the tailgate is opened after the system enters the auto lock mode.
- If the power tailgate is not fully closed.

The walk away auto lock system can be cancelled temporarily by using the customized settings. See the owner's manual for more information.

Keyless Access System Operation Manual Customize

The keyless access system can be enabled and disabled by the operation according to the table shown below. The system is enabled and disabled each time the unlock button is pressed on the remote during the customize mode.

Keyless Access System Description - Components

Engine Start/Stop Switch

When pressing the engine start/stop switch, it changes the vehicle to the OFF (LOCK), ACCESSORY, or ON mode. The engine start/stop switch also includes an LF antenna and receives the immobilizer signal from the keyless access control unit.

LF (Low Frequency) Antennas

The front interior, middle interior, rear interior, front door outer handle, and rear bumper LF antennas send the signals to the remote when the remote is outside out of the vehicle.

Remote

The remote is equipped with a keyless transmitter, and all the doors can be locked and unlocked by a lock/unlock button operation, even from a remote distance from the vehicle. When the lock button or unlock button is pressed, the keyless transmitter sends the applicable switch signal to the body control module. After receiving authentication, the body control module controls the door lock/unlock actuator.

Door Touch Sensors and Outer Handle Lock Sensers, Tailgate Outer Handle Switch and Lock Switch

The door touch sensors and the outer handle lock sensors are built into the driver's and front passenger's door outer handles. The tailgate outer handle switch is built into the tailgate outer handle. To operate the door locks without the built-in key while carrying the remote, grip the door outer handle to unlock the doors and press the outer handle lock switch on the door outer handle to lock the doors.

Electric Steering Lock (with electric steering lock)

Pressing the engine start/stop switch changes the vehicle mode to the OFF (LOCK), ACCESSORY, ON, or START mode. The engine start/stop switch also includes an LF antenna. When operating the backup function, the engine start/stop switch receives the immobilizer signal from the remote, and sends an immobilizer signal to the body control module.

Keyless Buzzer

The keyless buzzer is located behind the rear bumper and sounds during smart entry functions.

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM

Keyless/Power Door Locks/Security System Description

Overview

Keyless Entry System

The keyless entry system allows you to press the LOCK button to lock all the doors. When you press the UNLOCK button once, only the driver's door unlocks. The other doors will unlock when you press the button a second time. (Depending on the settings all the doors may unlock, when you press the button the first time). The doors will not lock with the transmitter if a door is not fully closed, or if the vehicle is turned to the ON mode.

When the switch for the interior light is in the DOOR position, it comes on when the UNLOCK button is pressed.If a door is not opened, the light goes off and the doors will relock in about 30 seconds. If the doors are locked with the transmitter within 30 seconds, the light goes off immediately.

Door Lock Control

The door lock control function allows the body control module to detect the status of various switch signals and controls each actuator in order to lock and unlock the doors.

The system has three circuits between door lock actuators and the body control module to improve safety of the system. One is for the driver's door lock actuator, and others are for the left rear door lock actuator and the passenger's side door lock actuators. The door lock actuator circuit has two fuses. When one fuse is blown, another fuse in the same circuit must be checked.

Tailgate Release Control (Without power tailgate)

The body control module activates the tailgate release actuator by operating the tailgate outer handle switch when the vehicle speed is less than 2 km/h (1.2 mph). The tailgate can be unlocked by the tailgate outer handle switch operation without having the remote if all the doors are unlocked.

Keyless Door Lock Control

The keyless transmitter or the remote can transmit a lock or unlock signal to the immobilizer-keyless control unit or the body control module. The body control module then controls the door lock actuator by the B-CAN signal and various other switch signals. The relock timer value can be set under the customization menu.

Keyless Door Lock Control (Tailgate)

The keyless transmitter or the remote can transmit a lock or unlock signal to the immobilizer-keyless control unit or the body control module, which sends the keyless request to the body control module using the B-CAN network. The control unit then controls the tailgate release function by a B-CAN signal and various other switch signals.

Automatic Door Lock/Unlock Control (For some models)

The automatic door lock/unlock control function allows the body control module to detect the status of B-CAN signals and various switch signals and controls each actuator in order to automatically lock/unlock the doors.

Automatic Door Lock Function:

- When the vehicle speed exceeds 9 mph (15 km/h) (Default setting)
- When the shift position/mode is out of the P position/mode

Automatic Door Unlock Function:

- When the driver's door switch is ON (door open) (Default setting)
- When the vehicle mode is changed to the OFF (LOCK) mode from the ON mode
- When the shift position/mode is moved to the P position/mode from other than the P position/mode

Customizing Function:

The locking method can be set to non-link, link to vehicle speed, link to shift position/mode, or link to ignition switch or engine start/stop switch by the customizing function. For more information about customize options, refer to the Owner's Manual.

Key Lockout Prevent Function

The body control module monitors whether or not there is a remote in the vehicle or a key inserted into the ignition key cylinder. If the remote is in the vehicle or the key is inserted into the ignition key cylinder, the body control module energizes the door lock actuator and unlocks the door.

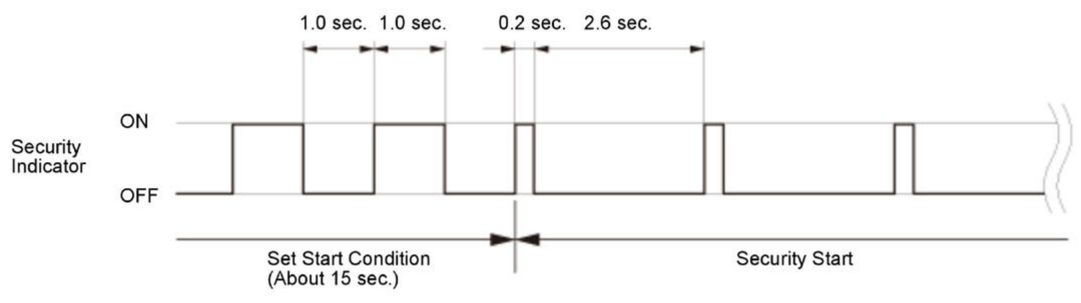
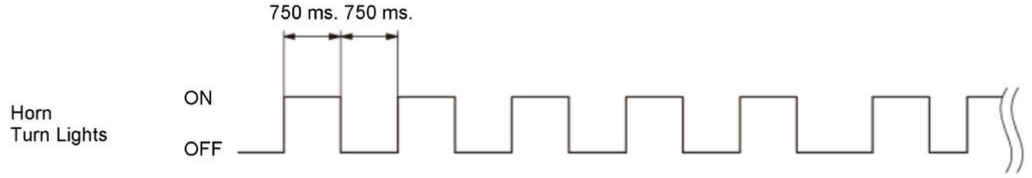
Security Setting

When the security alarm is set, the body control module sends the security set signal using the B-CAN. When the gauge control module receives a security set signal from the body control module, the security indicator flashes at a slower pace to indicate the system has armed.



Security Alarm

With the security system armed, manually opening the hood, the tailgate, moving the door lock knob to the unlock position, or shift to other than the P position/mode activates the security alarm. During activation, the horn sounds, the turn signal lighs blink, repeating this alarm (one cycle is 120 seconds). Even if you remove the 12 volt battery, the alarming state cannot be changed. The alarm starts again when reinstalling the 12 volt battery.



Answer Back Control

When using the remote, the body control module provides an answer back function to alert the customer that the body control module received a lock or unlock command from the remote or the immobilizer-keyless control unit. When the body control module receives a lock signal, the body control module outputs once to turn on the turn signal lights, and the keyless buzzer will sound. When the body control module receives an unlock signal, the body control module outputs two times to turn on the turn signal lights, and the keyless buzzer will sound.

Keyless/Power Door Locks/Security System Description - Components

Door Lock Switches

The door lock switches are integrated into one unit to the power window master switch, and the front passenger's power window switch.

Door Lock Knob Switch/Door Lock Actuator/Driver's Door Key Cylinder Switch

The door lock knob switch and the door lock actuator are built into the door latch of each door. The door lock knob switch detects the lock and unlock states of the lock mechanism. The door lock actuator moves the lock mechanism back and forth between the lock and unlock position. The actuator receives lock and unlock commands from the body control module. The driver's door key cylinder switch is included in the driver's door latch assembly. In conjunction with the key cylinder, it detects the lock/unlock of the key cylinder.

Tailgate Release Actuator/Tailgate Latch Switch (Without Power Tailgate)

The body control module receives an ON signal from the tailgate outer handle switch, which then outputs a signal to the tailgate release actuator, and unlocks the tailgate latch. The tailgate latch switch is the ON/OFF switch that detects the opening/closing of the tailgate. If the tailgate release actuator is bad, the tailgate may be opened manually with the lock lever.

CHECK

IMMOBILIZER SYSTEM CHECK

1. Connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. Monitor the SYSTEM CHECK in IMMOBILIZER INFO with the HDS.

NOTE: If the HDS does not communicate with the immobilizer-keyless control unit, check the power, ground, and K LINE connections.If the HDS displays NORMAL N-1, the immobilizer system is OK at this time. If the HDS displays any messages, check as follows:

System Check No.	System Check	Possible Cause
A-1	The key is not registered(Incorrect key code)	• This key is not registered in the immobilizer-keyless control unit. Try to register keys using the HDS. • No communication between the antenna and the immobilizer key because of interference from metal such as key chains/key rings/other keys. • Low 12 volt battery voltage.
A-2	Communication error between the key and immobilizer-keyless control unit(Incorrect key code format)	• Intermittent interruption between transponder and immobilizer-keyless control unit. • The immobilizer key type is different. It is not for this vehicle but for another vehicle or for another company's vehicle. • Key failure (transponder failure). • No communication between the antenna and the immobilizer key because of interference from metal such as key chains/key rings/other keys. • Low 12 volt battery voltage.
A-3	No communication between the key and immobilizer-keyless control unit(No transponder detected)	• The vehicle was turned to the ON mode with a non-immobilizer key. • The immobilizer key type is different. It is not for this vehicle but for another vehicle or for another company's vehicle. • Key failure (transponder failure). • No communication between the antenna and the immobilizer key because of interference from metal such as key chains/key rings/other keys. • Low 12 volt battery voltage.

1. Connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. On the HDS screen, at SYSTEM SELECTION MENU, enter ONE-PUSH START, then select KEYLESS ACCESS CONTROL UNIT or BACKUP CONTROL UNIT.

NOTE: If the HDS does not communicate, check the body control module power, ground, K line, and L-line connectors.

4. At KEYLESS ACCESS CONTROL UNIT, enter KEYLESS ACCESS SYSTEM INFORMATION, then select SYSTEM CHECK 1 or SYSTEM CHECK 2.

5. At BACKUP CONTROL UNIT, enter SYSTEM INFORMATION, then select SYSTEM CHECK.If the HDS displays NORMAL N-1, the immobilizer system is OK at this time, refer to the STATUS LOG. If the HDS displays any other messages, check as follows:

INPUT TEST

IMMOBILIZER-KEYLESS CONTROL UNIT INPUT TEST

SRS components are located in this area. Review the **SRS component locations** and the **precautions and procedures** before doing repairs or service.

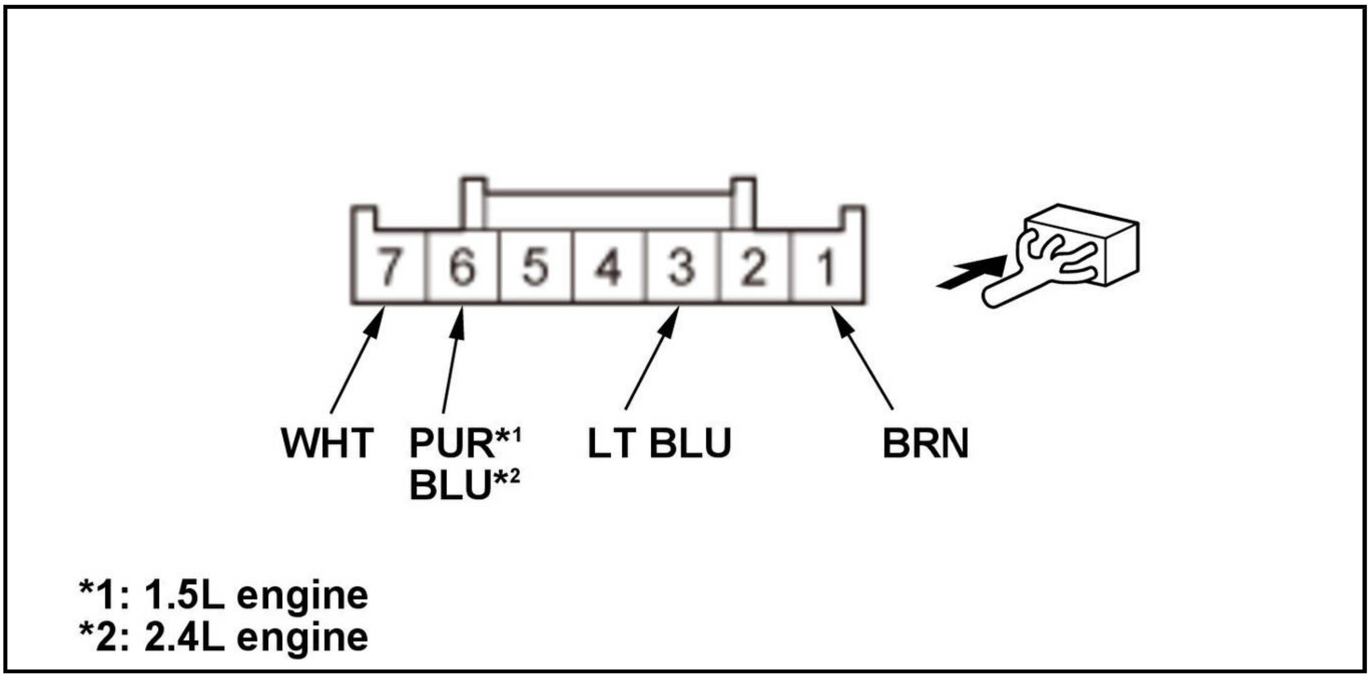
NOTE:

- Make sure the fuses associated with the system are OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the immobilizer-keyless control unit 7P connector.

Immobilizer-Keyless Control Unit 7P Connector (female terminals)



Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

Reconnect the connector to the immobilizer-keyless control unit, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, replace the immobilizer-keyless control unit .

NOTE: After replacing the immobilizer-keyless control unit, and do the immobilizer key registration.

10. If multiple failures are found on more than one control unit, replace the body control module . If input failures are related to a particular control unit, replace the control unit.

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM (BODY CONTROL MODULE, DOOR MULTIPLEX CONTROL UNIT, AND FRONT PASSENGER'S POWER WINDOW SWITCH) INPUT TEST

- Make sure the fuses associated with the system is OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in B-CAN System Diagnosis Test Mode A .
- Before testing, make sure the headlights, parking lights, side marker lights, taillights, and horns work properly.

TROUBLESHOOTING

KEYLESS ACCESS SYSTEM TOUCH SENSOR CIRCUIT TROUBLESHOOTING

Touch Sensor Circuit Troubleshooting

1. Keyless access system check

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA.

   One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

   Select HISTORY CLEAR, and back to TEST MODE menu:

NOTE: When the freeze data is cleared, the information indicates "NOT CONFIRMED".

- DRIVER DOOR UNLOCK SWITCH
- DRIVER DOOR LOCK SWITCH
- FRONT PASSENGER DOOR UNLOCK SWITCH
- FRONT PASSENGER DOOR LOCK SWITCH

-3. Turn the vehicle to the OFF (LOCK) mode.

-4. Get out of the vehicle with the keyless remote, and touch the each door outer handle touch sensors.

-5. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Recheck HISTORY DATA.

- DRIVER DOOR UNLOCK SWITCH
- DRIVER DOOR LOCK SWITCH
- FRONT PASSENGER DOOR UNLOCK SWITCH
- FRONT PASSENGER DOOR LOCK SWITCH

Is all the information OK?

YES

Intermittent failure, the system is OK at this time.

NO

Go to step 2.

2. Open wire check (GND line)

-1. Disconnect the following connectors.

Each door outer handle 8P connectors

-2. Check for continuity between test points 1 and 2 individually.

Driver's door

Test condition	Vehicle OFF (LOCK) modeDriver's door outer handle 8P connector: disconnected
Test point 1	Driver's door outer handle 8P connector (female terminals) No. 8: ①

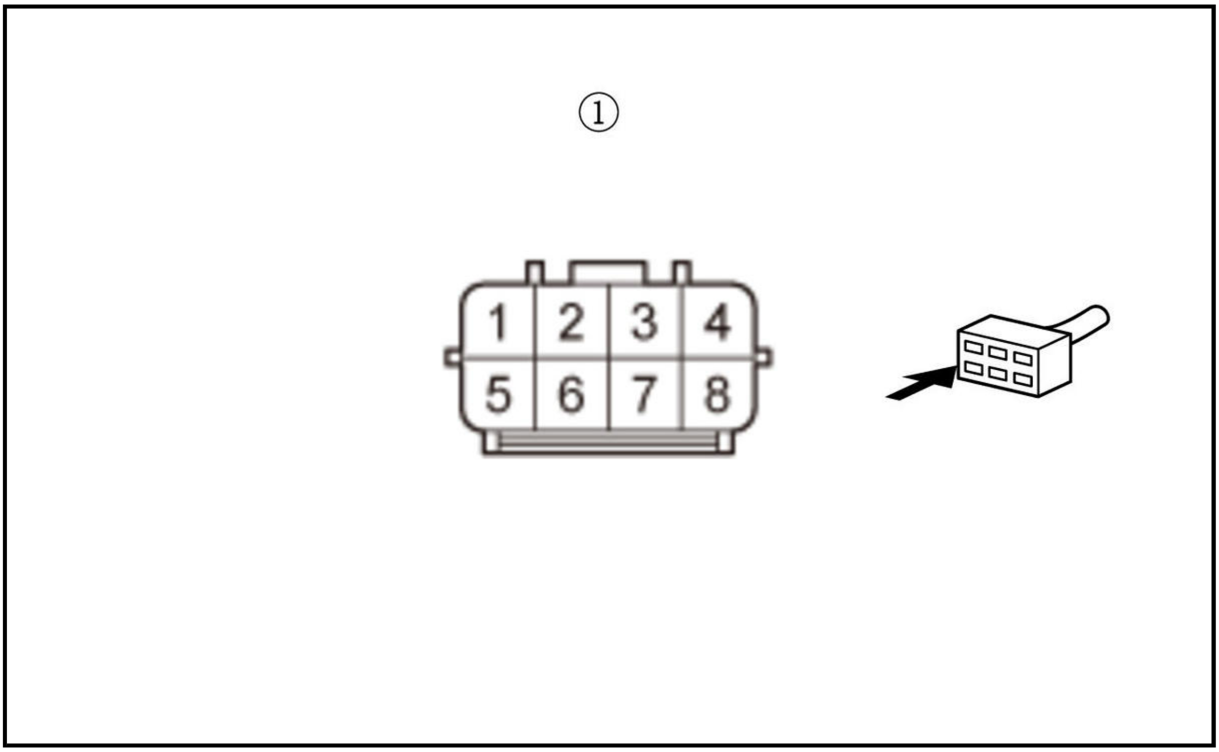
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wires are OK. Go to step 3.

NO

Repair an open or high resistance in the ground wire or poor ground (G401, G402).

3. Determine possible failure area (TS lines, DL lines, VOUT lines)

-1. Measure the voltage between test points 1 and 2 individually.

Driver's door

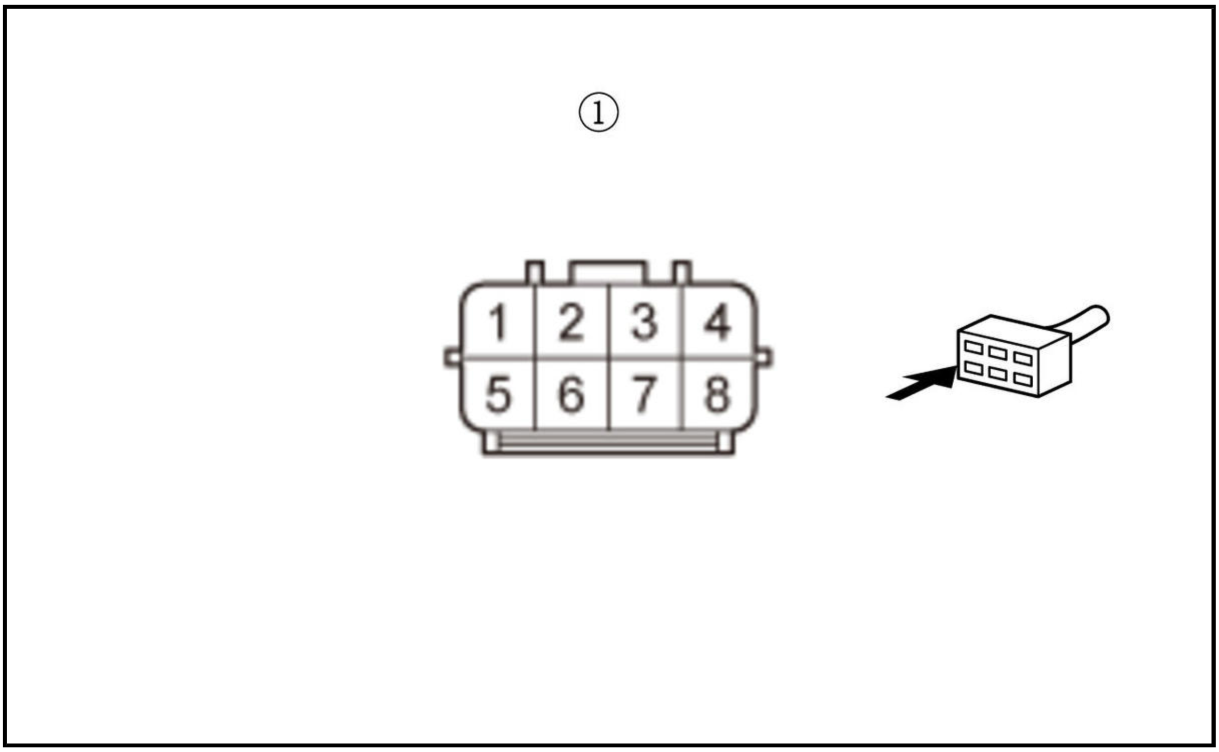
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 4: ①
Test point 2	Body ground



Is there battery voltage?

YES

Go to step 4.

NO

Go to step 7.

4. Open wire check (TS lines, DL lines)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2 individually.

Driver's door

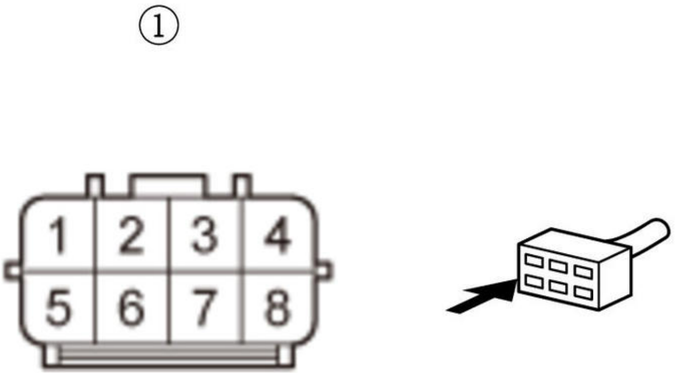
Test point 1	Front passenger's door outer handle 8P connector (female terminals) No. 7: ①
Test point 2	**Body control module connector G (32P) No. 1**



Is there continuity?

YES

The TS and DL wires are not open. Go to step 5.

NO

Repair an open or high resistance in the wire.

5. Shorted wire check (TS lines, DL lines)

-1. Check for continuity between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) modeEach door outer handle 8P connectors: disconnectedBody control module connector G (32P): disconnected
Test point 1	**Body control module connector G (32P) No. 22**

Test point 1	**Body control module connector G (32P) No. 1**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The TS and DL wires are OK. Go to step 6.

6. Door outer handle touch sensor check (substitution)

-1. **Substitute a known-good door outer handle touch sensors** , and recheck.

Is the system OK?

YES

Faulty the original door outer handle touch sensor; **replace the door outer handle** .

NO

Replace the body control module .

7. Open wire check (VOUT lines)

-1. Measure the voltage between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) modeEach door outer handle 8P connectors: disconnected
Test point 1	**Body control module connector G (32P) No. 31**
Test point 2	Body ground

Test point 1	**Body control module connector G (32P) No. 30**
Test point 2	Body ground

Is there battery voltage?

YES

Repair an open or high resistance in the wire.

NO

The VOUT wires are OK. **Replace the body control module** .

KEYLESS BUZZER CIRCUIT TROUBLESHOOTING

Keyless Buzzer Circuit Troubleshooting

1. Open wire check (GND line)

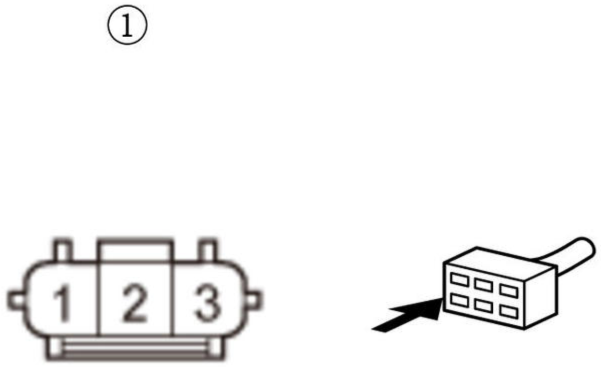
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Keyless buzzer 3P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeKeyless buzzer 3P connector: disconnected
Test point 1	Keyless buzzer 3P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Go to step 2.

NO

Repair an open or high resistance in the ground wire or poor ground (G505 (except japan production) / G506 (japan production)).

2. Open wire check (SMART BUZZER line)

-1. Disconnect the following connector.

Body control module connector E (24P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeKeyless buzzer 3P connector: disconnectedBody control module connector E (24P): disconnected

Is there continuity?

YES

The SMART BUZZER wire is not open. Go to step 3.

NO

Repair an open or high resistance in the wire.

3. Shorted wire check (SMART BUZZER line)

-1. Remove the jumper wire from the keyless buzzer 3P connector.

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeKeyless buzzer 3P connector: disconnectedBody control module connector E (24P): disconnected
Test point 1	**Body control module connector E (24P) No. 22**

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The SMART BUZZER wire is OK. Go to step 4.

4. Keyless buzzer check (substitution)

-1. **Substitute a known-good keyless buzzer** .

-2. Check the keyless buzzer function.

Does the keyless buzzer sound?

YES

Replace the original keyless buzzer .

NO

Replace the body control module .

REPAIR PROCEDURES, TESTS

IMMOBILIZER KEY REGISTRATION

Procedure

1. Immobilizer Key - Register

NOTE:

- The HDS is required for registration of the immobilizer keys.
- Programming the immobilizer also programs the keyless transmitter.
- Check for aftermarket electrical equipment that can cause problems with transponder operation.
- The immobilizer-keyless control unit can store up to six immobilizer keys.

Replace any of the Keys

NOTE: If any of the registered keys were lost, do the following procedure to delete the lost registered key.

1. Have at least one original key, all other keys to be registered and the first password.

2. **Connect the HDS to the data link connector (DLC)**

3. Turn the vehicle to the ON mode.

4. Select "Immobilizer Setup Tool".

5. Select the appropriate items, and do the registration according to the instructions on the HDS screen.

6. After registration, verify systems work normally with all keys.

All Keys are Lost

1. Prepare all new keys and have the immobilizer PCM code.

2. Connect the HDS to the data link connector (DLC)

3. Select "Immobilizer Setup Tool", and turn the vehicle to ON mode according to the instructions on the HDS screen.

4. Select the appropriate items, and do the registration according to the instructions on the HDS screen.

5. After registration, verify systems work normally with all keys.

IMMOBILIZER SYSTEM REGISTRATION

Procedure

1. Immobilizer System - Register

NOTE:

- The HDS is required for registration of the immobilizer keys.
- Programming the immobilizer also programs the keyless transmitter.
- Check for aftermarket electrical equipment that can cause problems with transponder operation.
- The immobilizer-keyless control unit can store up to six immobilizer keys.

When Replacing the Immobilizer-Keyless Control Unit

1. Have all registered keys and the PCM code.

2. Connect the HDS to the data link connector (DLC)

3. Turn the vehicle to the ON mode.

4. Select "Immobilizer Setup Tool".

5. Select the appropriate items, and do the registration according to the instructions on the HDS screen.

NOTE: Program all of the customer's keys.

6. After registration, verify systems work normally with all keys.

When Replacing the PCM, the Body Control Module, or the VSA Modulator-Control Unit

1. Have the PCM code.

2. Connect the HDS to the data link connector (DLC)

3. Turn the vehicle to the ON mode.

4. Select "Immobilizer Setup Tool".

5. Select the appropriate items, and do the registration according to the instructions on the HDS screen.

6. After registration, verify systems work normally with all keys. If the PCM is replaced, do the procedure after replacing PCM .

KEYLESS ACCESS SYSTEM REGISTRATION

Procedure

NOTE: If you replace the body control module or the steering lock, the vehicle will not turn to the ON mode. Follow the registration procedure of the corresponding unit.

1. Keyless Access System - Register

   NOTE:

   - Check for aftermarket electrical equipment that could cause problems with keyless access operation.
   - While doing the registration, keep the remote away from computers.
   - While doing the registration, make sure the doors are closed.
   - Programming the remote also programs the keyless transmitter.
   - The body control module can store codes up to 6 remotes.

   When Replacing the Body Control Module or the Electric Steering Lock Control Unit

   1. **Connect the HDS to the data link connector (DLC)**

   2. Do the registration according to the "Immobilizer Setup Tool" screen.

   3. After registration, verify all remote related systems work normally with all remotes.

   When Replacing the PCM, the VSA Modulator-Control Unit, or Registration of the Remote(s)

   NOTE: If the body control module was replaced, register the body control module first.

   1. **Connect the HDS to the data link connector (DLC)**

   2. When all remotes are lost, select "Immobilizer Setup Tool", and turn the vehicle to ON mode according to the instructions on the HDS screen, then go to step 5.

   3. Turn the vehicle to the ON mode.

   4. Select "Immobilizer Setup Tool".

   5. Select the appropriate items, and do the registration according to the instructions on the HDS screen.

   6. After registration, verify systems work normally with all remotes. If the PCM is replaced, **do the procedure after replacing PCM** .

HOMELINK REMOTE CONTROL SYSTEM TEST

NOTE:

- Explain to the customer that garage door remote transmitters come in two types: Fixed code and rolling code. Each type has its own programming method, and each method is covered in the Owner's Manual. If the customer has concerns about the HomeLink B® unit, have the customer contact the HomeLink B® assistance desk at 800-355-3515.
- If HomeLink B® will not open the customer's garage, do the following procedures.
- Before testing, make sure the fuses associated with the system is OK.

With Panoramic Glass Roof

Press any of the buttons on the HomeLink B® unit.

- If the red indicator comes on, go to step 6.
- If the red indicator does not come on, go to step 2.

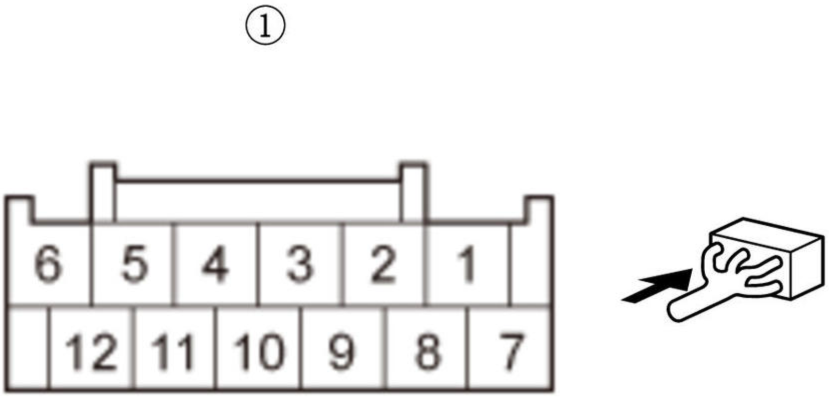
Do the HomeLinkB® switch test.

- If the switch is OK, go to step 3.
- If the switch is faulty, **replace the roof console module** .

3. Disconnect the HomeLink B® unit 12P connector.Check for continuity between the HomeLink B® unit and the HomeLink B® switch (built into the roof console module).

- If there is continuity, go to step 5.
- If there is no continuity, repair an open or high resistance in the wire.

Test circuit	**HomeLinkB® unit12P connector**	**Roof console module connector B (12P) (female terminals):** ①
VSW	1	8
SW1	7	9
SW2	10	10
SW3	4	11
LED+	9	7
LED-	12	12

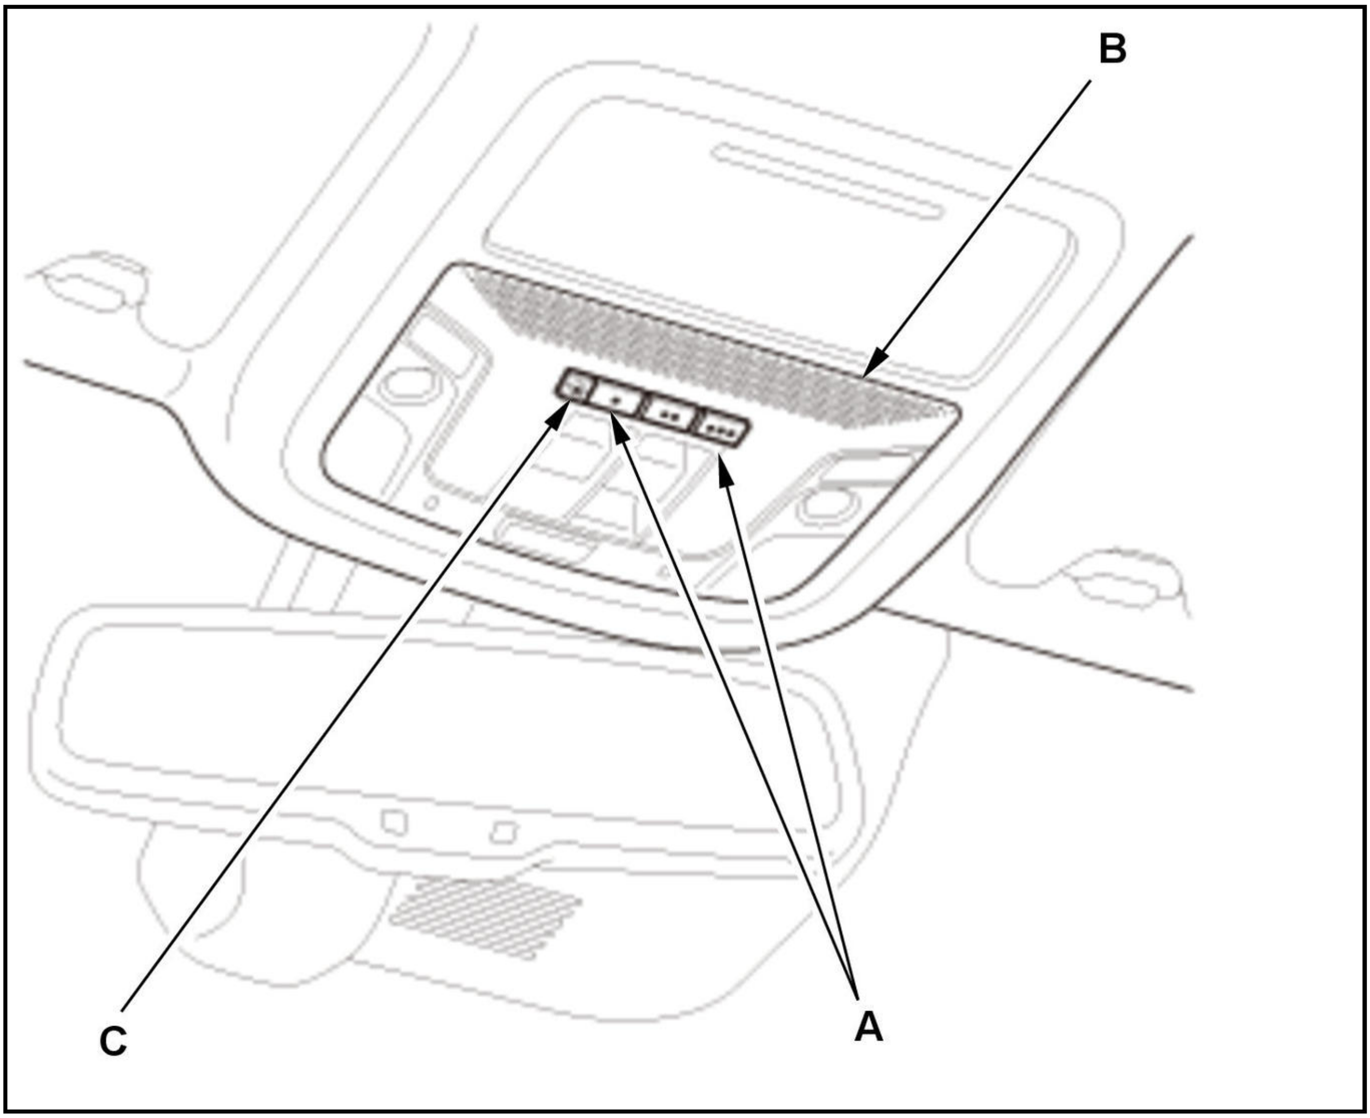


Measure the voltage between **HomeLinkB® unit 12P connector terminals No. 6 (+) and No. 3 (-)**. There should be battery voltage.

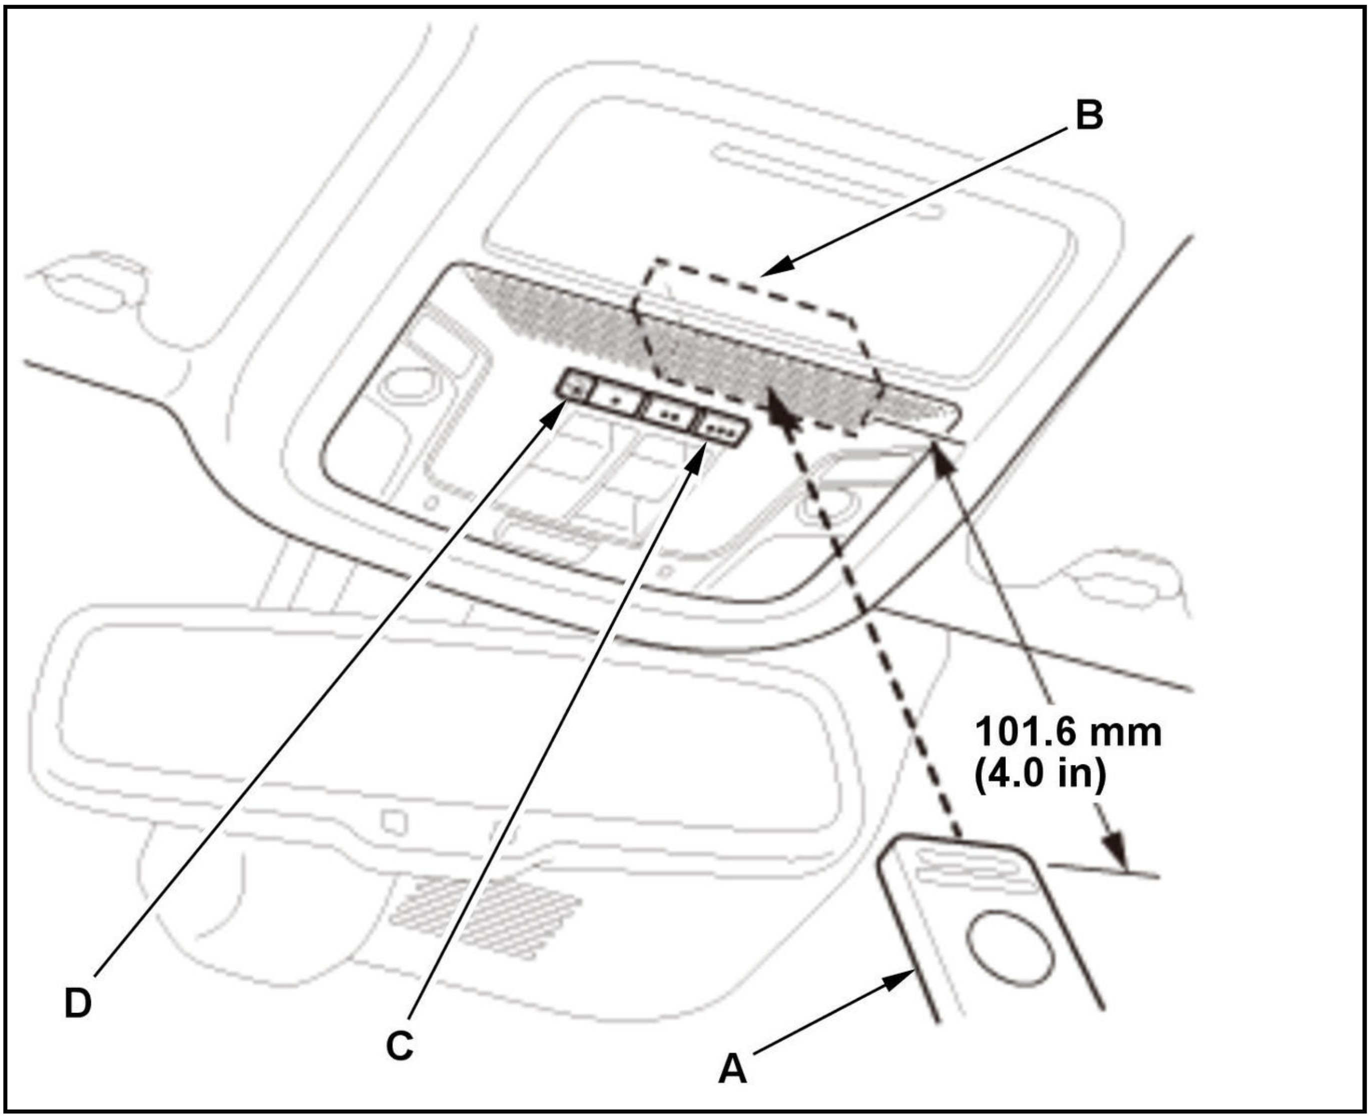
- If the voltage is not as specified, check for these problems:
-
    - An open or high resistance in the wire.
    - Poor ground (G401).
- If the voltage is as specified, go to step 6.

6. Make sure the customer's remote transmitter (or a test remote) has fresh batteries.

7. Clear any previously learned codes by pressing and holding the two outside buttons (A) on the roof console module (B) until the red indicator (C) on the unit starts blinking (about 20 seconds), then release the buttons.



8. Point the test remote transmitter (A) straight up exactly 101.6 mm (4.0 in) away from the HomeLink B® unit (B).



9. Press and hold the test transmitter button and one of the HomeLink B® switch (C) at the same time.Wait for about 20 seconds while watching the red indicator (D) on the HomeLink B® switch.

- If the red indicator starts out blinking slowly and then blinks faster, the unit is OK. Release the buttons, then clear the learned code (see step 1). For more information, contact the HomeLink B® assistance desk at 800-355-3515 or go online to www.homelink.com.
- If the red indicator does not blink, the HomeLink B® unit is faulty; **replace it** .

Without Panoramic Glass Roof

Press any of the buttons on the HomeLink B® unit.

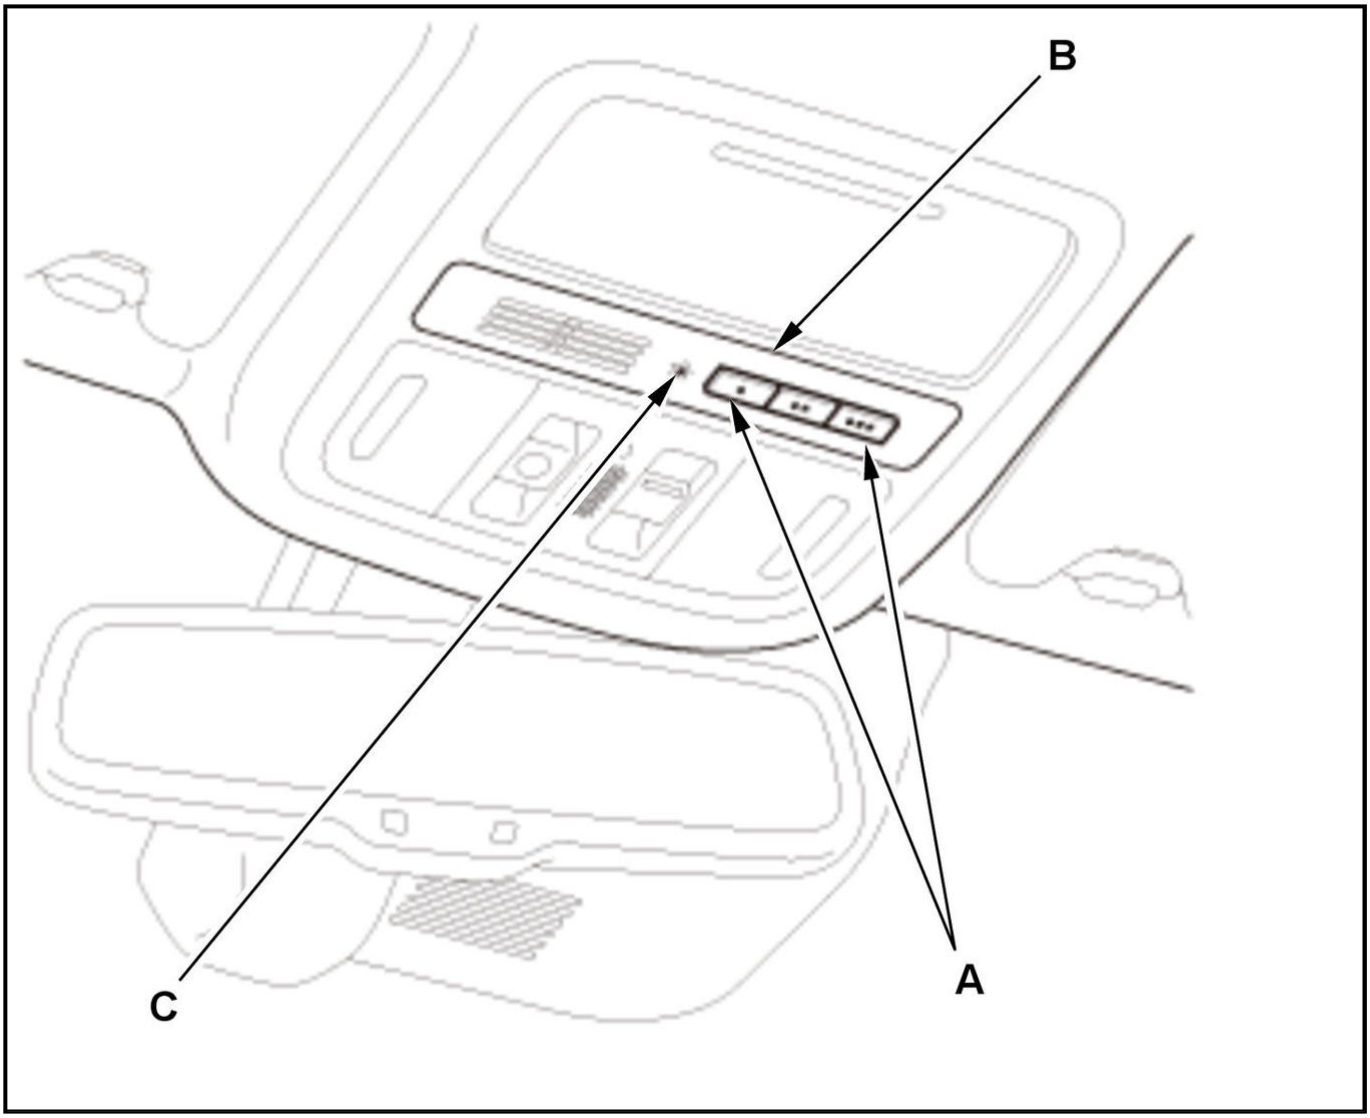
- If the red indicator comes on, go to step 4.
- If the red indicator does not come on, go to step 2.

2. Disconnect the HomeLink B® unit 5P connector.Measure the voltage between **HomeLinkB® unit 5P connector terminals No. 1 (+) and No. 4 (-)**. There should be battery voltage.

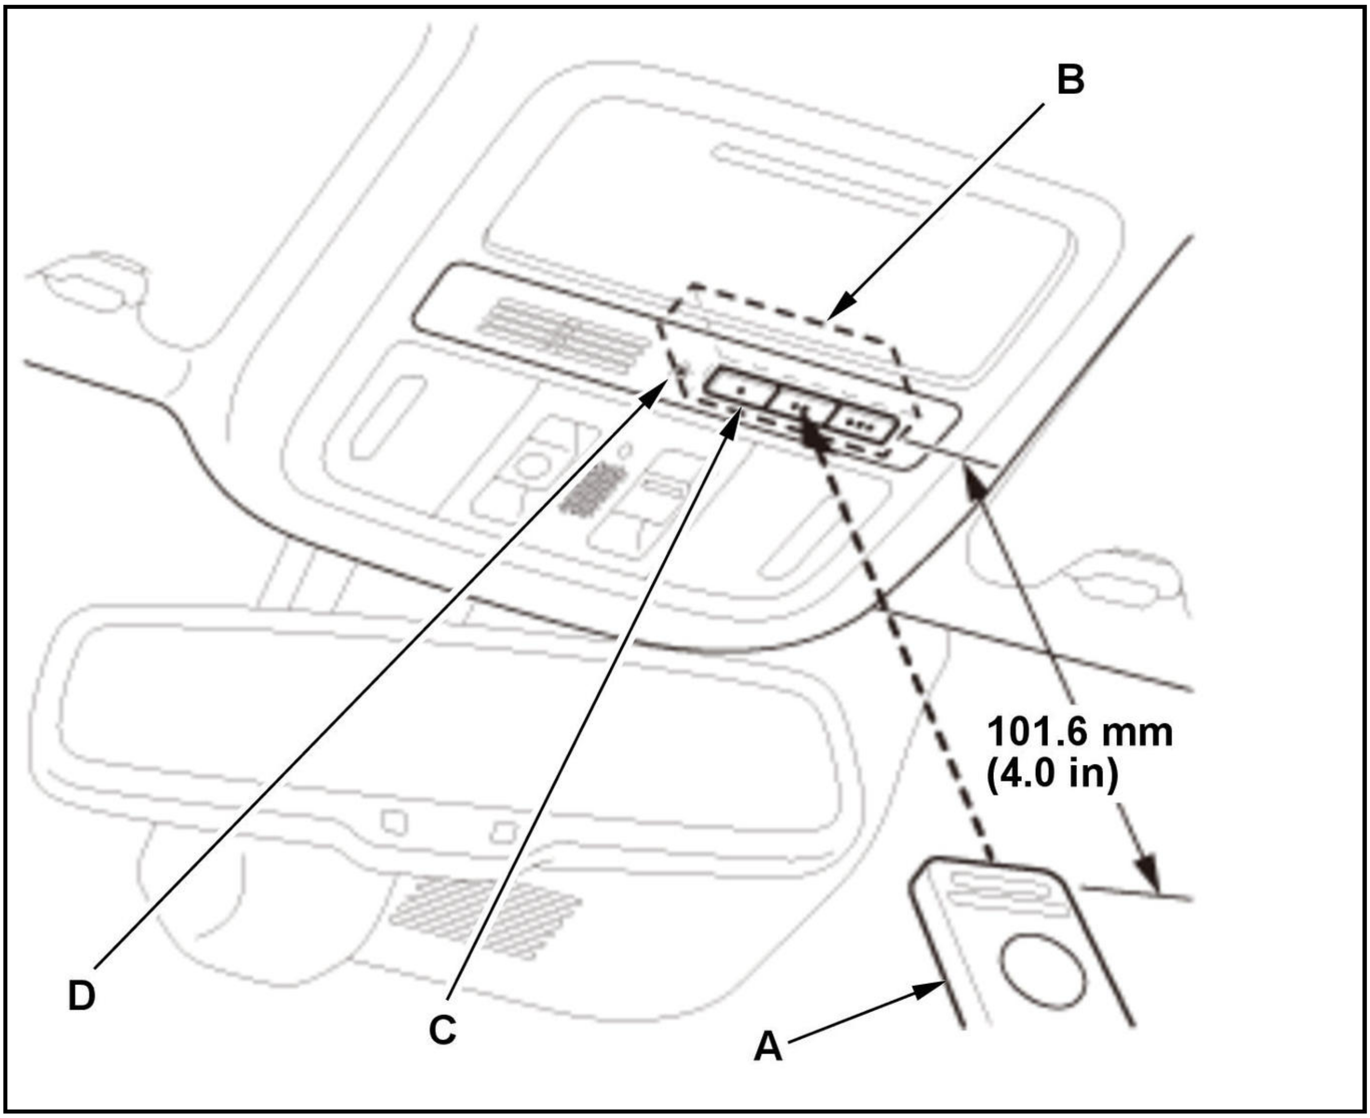
- If the voltage is not as specified, check for these problems:
-
    - An open or high resistance in the wire.
    - Poor ground (G401).
- If the voltage is as specified, go to step 4.

4. Make sure the customer's remote transmitter (or a test remote) has fresh batteries.

5. Clear any previously learned codes by pressing and holding the two outside switches (A) on the roof console (B) until the red indicator (C) on the unit starts blinking (about 20 seconds), then release the switches.



6. Point the test remote transmitter (A) straight up exactly 101.6 mm (4.0 in) away from the HomeLink B® unit (B).



7. Press and hold the test transmitter button and one of the HomeLink B® switch (C) at the same time.Wait for about 20 seconds while watching the red indicator (D) on the HomeLink B® switch.

- If the red indicator starts out blinking slowly and then blinks faster, the unit is OK. Release the switches, then clear the learned code (see step 1). For more information, contact the HomeLink B® assistance desk at 800-355-3515 or go online to www.homelink.com.
- If the red indicator does not blink, the HomeLink B® unit is faulty; **replace it** .

HOMELINK SWITCH TEST(WITH ROOF CONSOLE MODULE)

Test

1. **Roof Console Module - Remove**
2. HomeLink Switch - Test

   NOTE: The HomeLink switch is built into the roof console module (A).

   1. Check for continuity between the terminals in each switch position according to the table.

   NOTE:

   - When an LED is located between terminals, check if the LED illuminates by connecting power and ground to the LED.
   - Note this important operating characteristic; diode bias causes a diode to fully conduct electricity in one direction (forward), while not at all in the opposite direction (reverse).

IMMOBILIZER SYSTEM STATUS LOG

If you suspect there is an immobilizer system problem, check the status log in the HDS.

1. **Connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. On the HDS screen, at SYSTEM SELECTION MENU, enter IMMOBI, then select IMMOBILIZER SETUP, select SYSTEM CHECK, NUMBER of KEYS and STATUS LOG, then select STATUS LOG.Check the STATUS LOG count. Troubleshoot the status with the highest count first. If no counts are listed, the immobilizer system is OK. Continue with normal symptom troubleshooting.

Status Log No.	Detected Item	Probable Cause
A-1	KEY CODE MISMATCH 1(Code format correct, but code data does not match)	• The key was not registered • Interference from metal such as key chains • Low 12 volt battery voltage

Status Log No.	Detected Item	Probable Cause
A-2	KEY CODE MISMATCH 2(Incorrect code format)	• The vehicle was turned to ON mode with another type of immobilizer key or aftermarket key • Interference from metal such as key chains • Low 12 volt battery voltage
A-3	KEY CODE MISMATCH 3(No transponder detected)	• The vehicle was turned to ON mode with another type of immobilizer key or aftermarket key • Interference from metal such as key chains • Low 12 volt battery voltage • Key failure • Immobilizer-keyless control unit failure
B-1	PCM CODE MISMATCH 1(Code format correct, but code data does not match)	• PCM was not registered correctly • Low 12 volt battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit • Communication line electrical noise
B-2	PCM MISMATCH 2(Incorrect code format)	• PCM was not registered correctly • Low 12 volt battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit • Communication line electrical noise
C-1	IMOES UNIT MISMATCH 1(Code format correct, but data does not match)	• Imoes unit was not registered correctly • Communication was not good between the imoes unit and the immobilizer-keyless control unit because of low 12 volt battery voltage • Communication was not good between the imoes unit and the immobilizer-keyless control unit because of electrical noise
C-2	IMOES UNIT MISMATCH 2(Incorrect code format)	• Imoes unit was not registered correctly • Communication was not good between the imoes unit and the immobilizer-keyless control unit because of low 12 volt battery voltage • Communication was not good between the imoes unit and the immobilizer-keyless control unit because of electrical noise

Status Log No.	Detected Item	Probable Cause
D-1	S-NET LINE PROBLEM 1(Short to ground)	• Low 12 volt battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit and the PCM • Communication line electrical noise
D-2	S-NET LINE PROBLEM 2(No communication)	• Blown fuse

Status Log No.	Detected Item	Probable Cause
		• Harness open from imoes unit to immobilizer-keyless control unit • Communication was not good between the imoes unit and the immobilizer-keyless control unit because of low 12 volt battery voltage • Communication was not good between the imoes unit and the immobilizer-keyless control unit because of electrical interference • Imoes unit failure • Immobilizer-keyless control unit failure
D-3	S-NET LINE PROBLEM 3(Open line or PCM failure)	• Open or short in the harness from the PCM to the immobilizer-keyless control unit • Low 12 volt battery voltage • Poor or loose terminal connections at the immobilizer-keyless control unit and the PCM • Poor S-NET data communication due to electrical interference

KEYLESS ACCESS LF ANTENNA FUNCTION TEST

NOTE: Before testing, check for DTCs. If any DTCs are indicated, troubleshoot the indicated DTCs first.

1. Connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS.

4. Select the SELF CHECK and if any malfunction is found, troubleshoot it first.Select the FUNCTIONAL TESTS, and do the antenna driving test by checking the transmitting areas between the LF antenna and the keyless remote (inside of the vehicle; except on the dashboard, in the glove box, door pockets, console box, and other enclosed areas.).

Outside of the vehicle

Transmitting Area	LF Antenna Location	HDS Indication (Functional Tests)
A	Driver's door LF Antenna	Driver (Door) Antenna Driving
B	Front passenger's door LF Antenna	Front Passenger (Door) Antenna Driving
C	Rear bumper LF Antenna	Trunk/Tailgate/Rear Bumper Antenna Driving

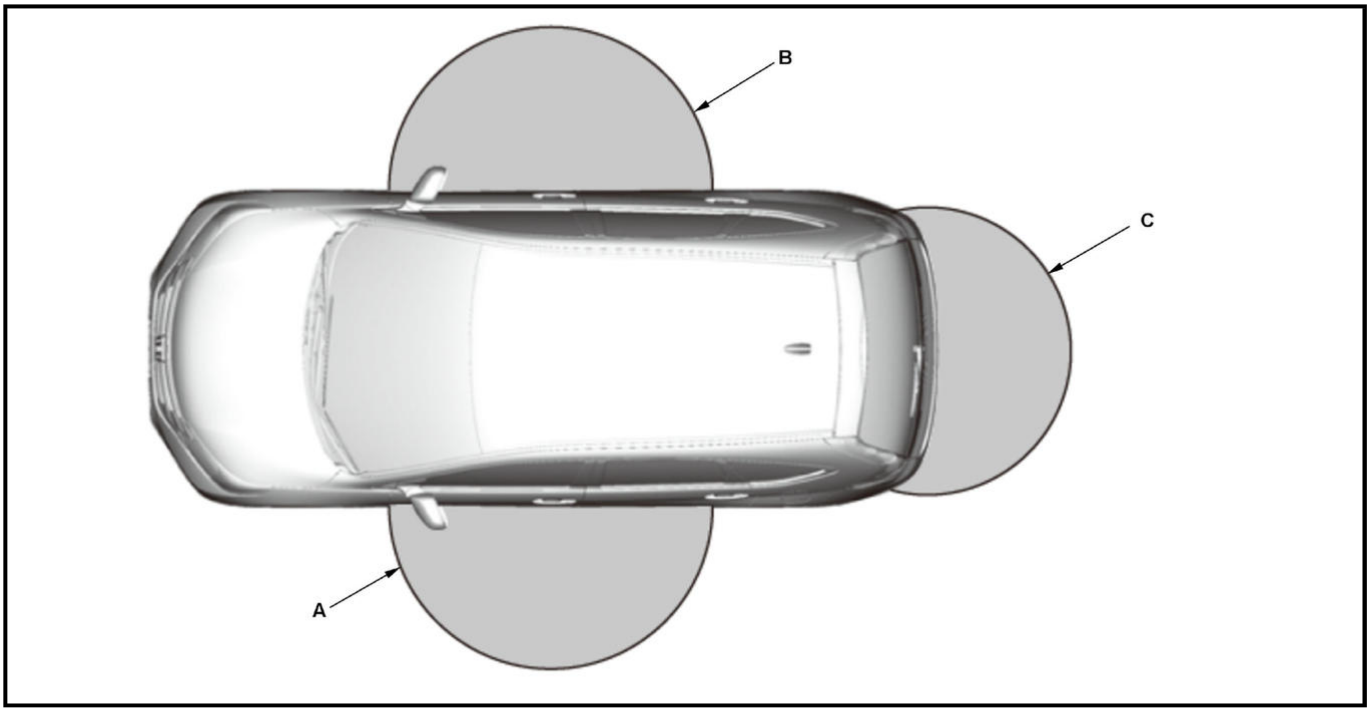
Inside of the vehicle

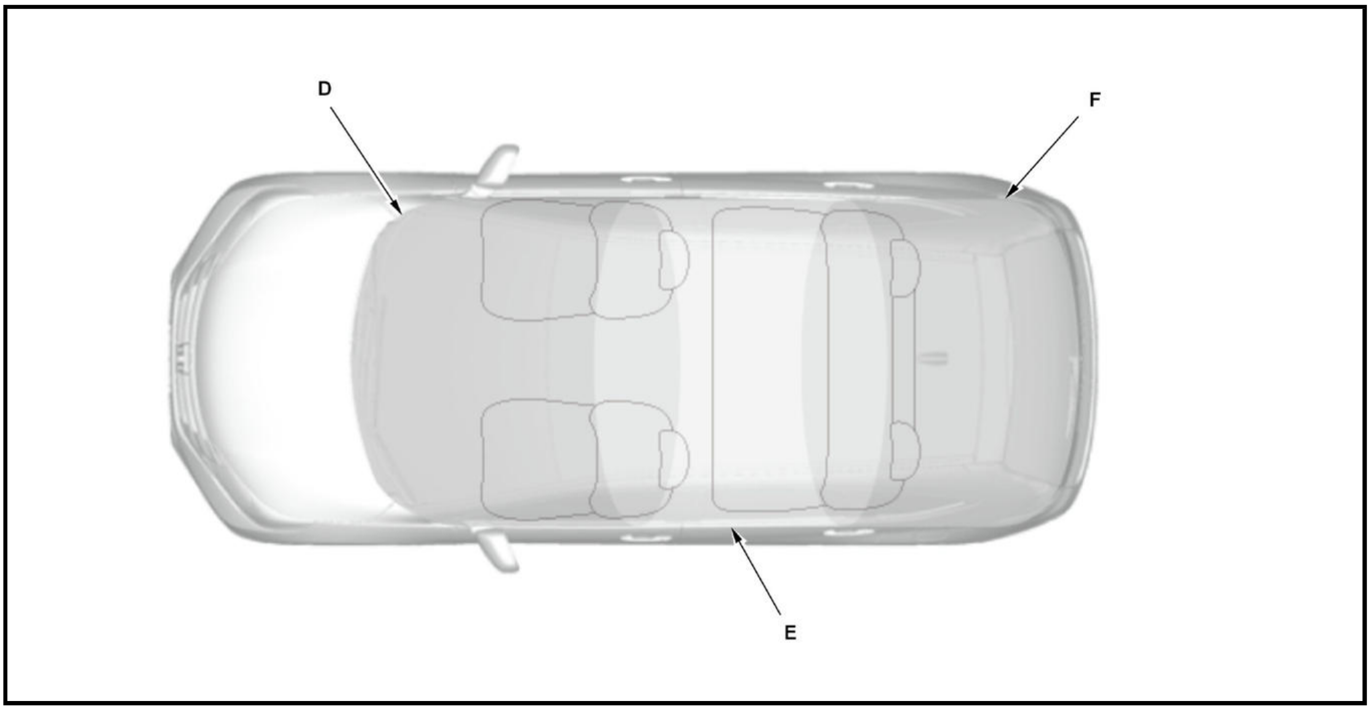
Transmitting Area	LF Antenna Location	HDS Indication (Functional Tests)
D	Front interior LF antenna	Front Interior Antenna Driving
E	Middle interior LF antenna	Middle Interior Antenna Driving
F	Rear interior LF antenna	Rear Interior Antenna Driving

NOTE:

- Functional Tests cannot operate at the same time, check the LF antennas one at a time.

- Outside of the vehicle; test the transmitting area at about 90 cm (35.4 in) height from the ground.
- The LED will blink when the keyless remote is within the shaded areas.





KEYLESS ACCESS SYSTEM STATUS LOG

If you suspect there is an immobilizer system problem, check the status log in the HDS.

1. Connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. On the HDS screen, at SYSTEM SELECTION MENU, enter ONE-PUSH START, then select KEYLESS ACCESS CONTROL UNIT or BACKUP CONTROL UNIT.

NOTE: If the HDS does not communicate, check the body control module power, ground, K line, and L-line connectors.

4. At KEYLESS ACCESS CONTROL UNIT, enter KEYLESS ACCESS SYSTEM INFORMATION, then select KEYLESS ACCESS STATUS LOG.

5. At BACKUP CONTROL UNIT, enter SYSTEM INFORMATION, then select STATUS LOG.Check the STATUS LOG count. Troubleshoot the status with the highest count first. If no counts are listed, the immobilizer system is OK. Continue with normal symptom troubleshooting.

Status Log (Keyless Access Control Unit)

Status Log No.	Possible cause
B-1B-2	• PCM was not registered correctly • Body control module was registered correctly • Poor connections or loose terminals between body control module and PCM • Poor connections or loose terminals in the IG1 line • Low 12 volt battery voltage • Electrical noise
C-1C-2	• Poor connections or loose terminals in the IG1 line • Body control module was not registered • Low 12 volt battery voltage • Electrical noise
D-1D-2D-3	• Poor connections or loose terminals between body control module and PCM • Low 12 volt battery voltage • Electrical noise • Blown fuse

Status Log (Backup Control Unit)

Status Log No.	Possible cause
A-1A-2A-3	• Keyless remote was not registered correctly • Engine start/stop switch failure
B-1B-2	• PCM was not registered correctly • Communication error between body control module and PCM • Low 12 volt battery voltage • Electrical noise
C-1C-2	• Body control module was not registered correctly • Poor connections or loose terminals in the IG1 line • Low 12 volt battery voltage • Electrical noise

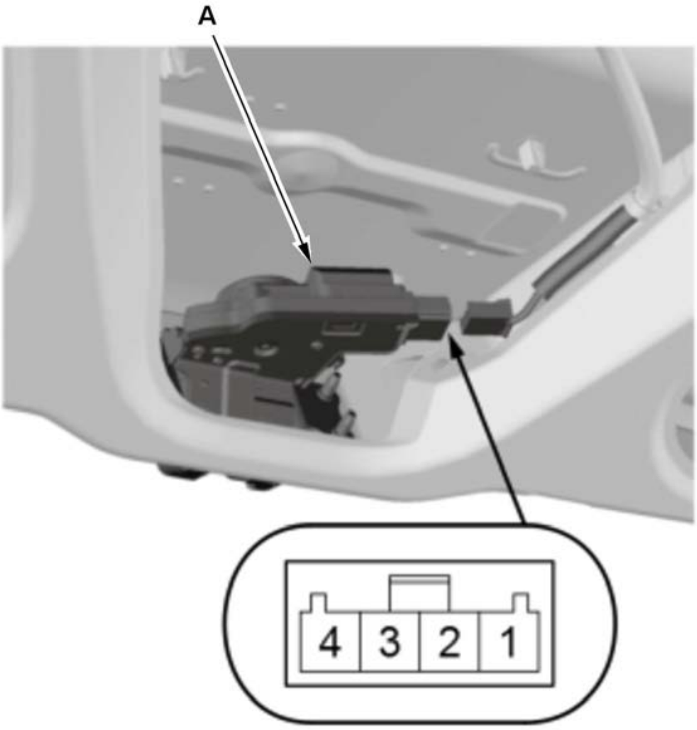
Status Log No.	Possible cause
D-1D-2D-3	• Poor connections or loose terminals between body control module and PCM

Status Log No.	Possible cause
	- S-NET line short - Low 12 volt battery voltage - Electrical noise - Blown fuse

TAILGATE RELEASE ACTUATOR TEST

Test

1. Tailgate Lower Trim Panel - Remove
2. Tailgate Release Actuator - Test



Terminal / Operation	3	4
Release	⊖	⊕

1. Disconnect the connector.

2. Check the actuator operation by connecting 12 volt power and ground according to the table.

NOTE: To prevent damage to the actuator, apply 12 volt battery voltage only momentarily.

3. If the actuator does not operate, the tailgate release actuator is faulty; replace the tailgate latch

(A).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

GENERAL INFORMATION

IMMOBILIZER SYSTEM SYMPTOM TROUBLESHOOTING INFORMATION

General Check Before Troubleshooting

Before troubleshooting the immobilizer system, check the following general items and resolve any issues, if applicable:

- The 12 volt battery is low; charge the 12 volt battery fully, then troubleshoot the immobilizer system.
- The ignition key is not a genuine Honda part; use a Honda-approved key blank, register the key, then troubleshoot the immobilizer system.
- If a key ring or a key case is used; remove the key from it, and troubleshoot the immobilizer system with the key only.
- An aftermarket electrical part is installed; remove it, then troubleshoot the immobilizer system.

Symptom Troubleshooting Using the Security Indicator Lighting Pattern

The pattern of the security indicator can help troubleshoot the condition of the immobilizer system. Here are descriptions of the four possible patterns:

Normal operation:

When turning the vehicle to the ON mode and the immobilizer code is identified, the security indicator is OFF.

Immobilizer code is not identified:

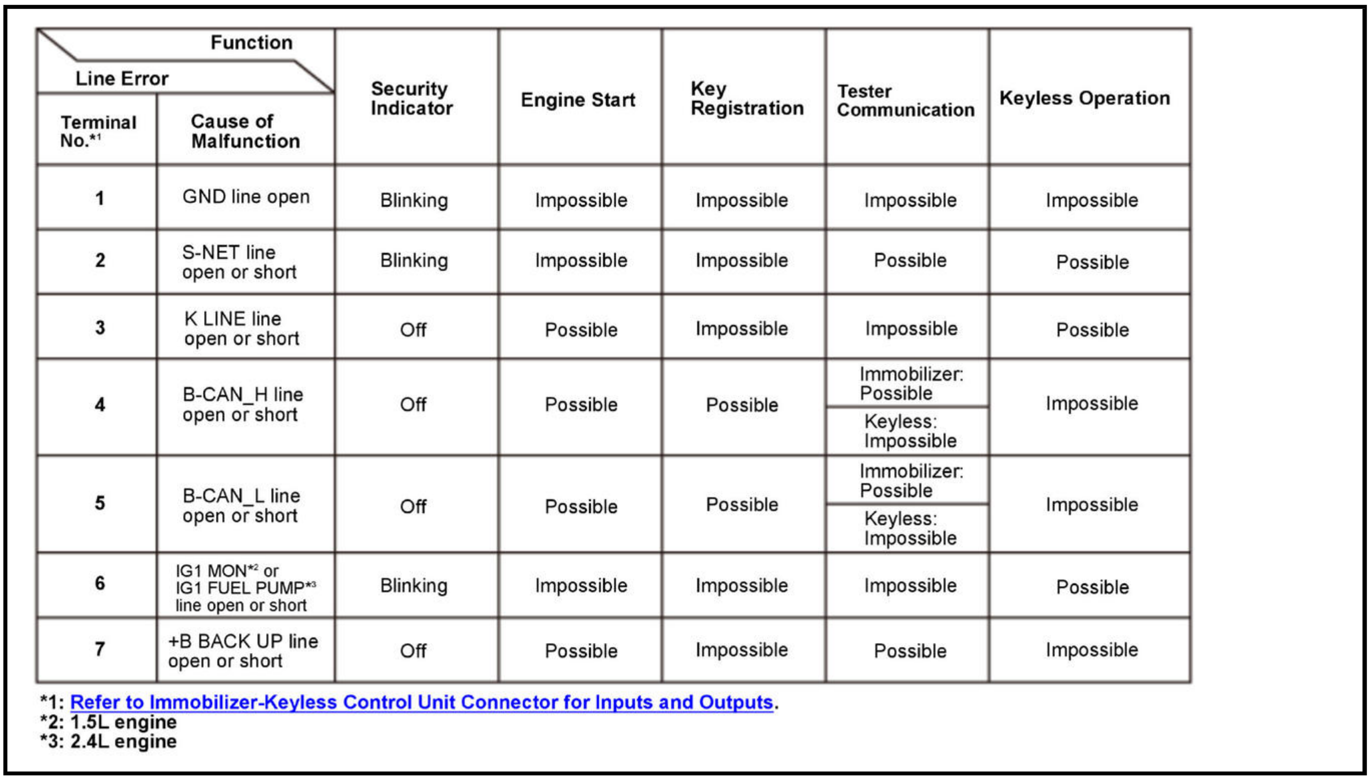
When turning the vehicle to the ON mode when the immobilizer code has not been identified, the security indicator blink until the OFF (LOCK) mode is selected. Then security indicator will come on for 1 second. The state of the keyless registration and the S-NET line can be checked by doing a **SYSTEM CHECK** and **STATUS LOG** with the HDS.

Security indicator turns on:

If the security indicator turns on, **do the gauge control module self-diagnostic function** . If the indicator drive circuit is OK, do the **SYSTEM CHECK** and **STATUS LOG** with the HDS.

Symptom Troubleshooting Using Malfunctioning Circuit Functions

If a malfunction occurs in the immobilizer circuit, use the table to cross-reference the malfunction criteria to the line(s) that should be checked in the table:



Function Line Error		Security Indicator	Engine Start	Key Registration	Tester Communication	Keyless Operation
Terminal No.*1	Cause of Malfunction					
1	GND line open	Blinking	Impossible	Impossible	Impossible	Impossible
2	S-NET line open or short	Blinking	Impossible	Impossible	Possible	Possible
3	K LINE line open or short	Off	Possible	Impossible	Impossible	Possible
4	B-CAN_H line open or short	Off	Possible	Possible	Immobilizer: Possible Keyless: Impossible	Impossible
5	B-CAN_L line open or short	Off	Possible	Possible	Immobilizer: Possible Keyless: Impossible	Impossible
6	IG1 MON*2 or IG1 FUEL PUMP*3 line open or short	Blinking	Impossible	Impossible	Impossible	Possible
7	+B BACK UP line open or short	Off	Possible	Impossible	Possible	Impossible

*1: Refer to Immobilizer-Keyless Control Unit Connector for Inputs and Outputs.
*2: 1.5L engine
*3: 2.4L engine

System Check

NOTE: The HDS can be used to check the state of the immobilizer key registration and the S-NET line by doing a SYSTEM CHECK.

1. **Connect the HDS to the data link connector (DLC)**

2. The vehicle is turned to the ON mode and follow the prompts to the SYSTEM SELECTION MENU.

3. At SYSTEM SELECTION MENU, enter IMMOBI, then select the IMMOBILIZER SETUP.

4. **Do the SYSTEM CHECK**. If there is a system check number, do the troubleshooting for the item indicated.

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING INFORMATION

General Check Before Troubleshooting

NOTE: Before troubleshooting the keyless access system, check the following items and solve any applicable issues.

- Make sure that keyless access system is not disabled by the customization.
- Make sure the fuses associated with the system is OK.
- Check for poor connection at the body control module.
- Check for DTCs with the HDS; if a DTC is indicated, troubleshoot the DTC first.
- Before testing, troubleshoot the keyless access system first using SELF CHECK, and if any malfunction is found, troubleshoot it first.
- Make sure the keyless remote is not in a purse with coins, wrapped with any metallic material, placed near a cell phone or computer.
- Make sure the vehicle 12 volt battery is fully charged.
- Make sure the keyless remote batteries are not low; if they are, replace keyless remote battery.
- Make sure a different keyless remote is not being used; only use a Honda-approved keyless remote.
- Make sure the keyless remote is not attached to a key ring or key case; if it is, remove the key from it.
- Make sure aftermarket accessories are not installed; remove any aftermarket accessories.
- Make sure aftermarket accessories are not connected to the S-NET or IGN TRX line; disconnect any aftermarket accessories from the S-NET or IGN TRX line.
- Make sure there is no electrical interference nearby; avoid areas with electrical or radio interference.

Symptom Troubleshooting Using the Security Indicator Lighting Pattern

The immobilizer and keyless access system condition can be checked by the security indicator lighting pattern.

Normal operation:

When turning the vehicle to the ON mode and the immobilizer code is identified, the security indicator is OFF.

Immobilizer code is not identified:

When turning the vehicle to the ON mode when the immobilizer code has not been identified, the security indicator blink until the OFF (LOCK) mode is selected. Then security indicator will come on for 1 second. The state of the keyless registration and the S-NET line can be checked by doing a **SYSTEM CHECK** and **STATUS LOG** with the HDS.

Security indicator turns on:

If the security indicator turns on, **do the gauge control module self-diagnostic function procedures** . If the indicator drive circuit is OK, do the **SYSTEM CHECK** and **STATUS LOG** procedures with the HDS.

System Check and Status Log

NOTE: The HDS can be used to:

- Check the state of the keyless remote registration and the S-NET line by doing a **SYSTEM CHECK**.
- Check the number of times the keyless access control unit or the backup control unit did not permit the engine to start by checking the **STATUS LOG**.

1. **Connect the HDS to the data link connector (DLC)**

2. At SYSTEM SELECTION MENU, enter ONE-PUSH START, then select KEYLESS ACCESS CONTROL UNIT or BACKUP CONTROL UNIT.

3. At KEYLESS ACCESS CONTROL UNIT, enter KEYLESS ACCESS SYSTEM INFORMATION, then select SYSTEM CHECK 1 or SYSTEM CHECK 2.

4. At BACKUP CONTROL UNIT, enter SYSTEM INFORMATION, then select SYSTEM CHECK.

5. Do the SYSTEM CHECK. If there is a system check number, do the troubleshooting for the item indicated.

6. **Check the STATUS LOG using the HDS**. Troubleshoot the line with the highest counts first. If all the lines are 0 (zero), the problem may not be caused by the immobilizer system or keyless access system, check for ignition or fuel problems.

NOTE: Once repaired, clear the status log by removing the BACK UP fuse in the under-hood fuse/relay box or disconnecting the 12 volt battery.

KEYLESS/POWER DOOR LOCKS/SECURITY SYSTEM TRIPPED SENSOR RECALL

The security system stores information on the last tripped sensor if the security system has been actuated. The information can be retrieved using the HDS.

To retrieve the last tripped sensor data, do this:

1. Select HISTORY DATA from the SECURITY MODE MENU.Scroll through the data list.

- Sensors that were actuated will indicate DETECT.
- Sensors that were not actuated will indicate NONE.

Inspect the DETECT circuit for:

- Misadjusted or damaged switch.
- Loose or corroded connections.
- Intermittent short to ground.

SYMPTOM TROUBLESHOOTING

IMMOBILIZER SYSTEM SYMPTOM TROUBLESHOOTING

Engine does not start with the immobilizer key

Engine does not start with the immobilizer key

NOTE: Before troubleshooting, check the items listed in General Check before Troubleshooting.

1. Problem verification

   -1. Try to start the engine.

   Does the engine start?

   YES

   Intermittent failure, the vehicle is OK at this time.

NO

Go to step 2.

2. Immobilizer system check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Turn the vehicle to the ON mode, and check the security indicator.

Does the indicator off?

YES

Go to step 3.

NO

Go to the security indicator blinks troubleshooting.

3. Starting system check

-1. Turn the vehicle to the START mode.

Does the starter motor run?

YES

Go to step 4.

NO

Go to starting system, and **check the starter motor** .

4. PGM-FI system check 1

-1. Try to start the engine with the immobilizer key.

Does the engine start?

YES

Go to step 5.

NO

Go to the PGM-FI system symptom troubleshooting .

5. PGM-FI system check 2

-1. Wait for a few minutes with the engine running.

Does the engine stop?

YES

Go to the PGM-FI system symptom troubleshooting .

NO

The system is OK at this time.

Security indicator blinks

NOTE: Before troubleshooting, check the items listed in General Check before Troubleshooting.

1. Immobilizer system check

   -1. Connect the HDS to the data link connector (DLC) .

   -2. Turn the vehicle to the ON mode.

   -3. From the SYSTEM SELECTION MENU, enter IMMOBI, then select IMMOBILIZER SETUP.

   NOTE: If the HDS does not communicate with the immobilizer-keyless control unit, check the power, ground, and K line connections.

   -4. Select the SYSTEM CHECK from the IMMOBILIZER INFO.

   Is SYSTEM CHECK indicated?

   YES

   Troubleshoot the immobilizer system according to the results of the SYSTEM CHECK.

   NO

   Go to step 2.

2. Open wire check (GND line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Enter the vehicle, and remove the ignition key from the ignition switch, then close all the doors and tailgate.

   -3. Operate the keyless transmitter LOCK and UNLOCK several times in the vehicle.

   Do the door lock actuators work normally?

   YES

   The GND wire is OK. Go to step 3.

   NO

   Repair an open or high resistance in the ground wire or poor ground (G401).

3. Open wire check (IG1 MON or IG1 FUEL PUMP line)

   -1. Turn the vehicle to the ON mode.

   -2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
Test point 1	Immobilizer-keyless control unit 7P connector No. 6
Test point 2	Body ground

   Is there battery voltage?

YES

The IG1 MON or IG1 FUEL PUMP wire is OK. **Replace the immobilizer-keyless control unit** .

NO

Repair an open or high resistance in the wire.

Security indicator turns on

Security indicator turns on

1. Immobilizer system check

   -1. **Connect the HDS to the data link connector (DLC)** .

   -2. Turn the vehicle to the ON mode.

   -3. From the SYSTEM SELECTION MENU, enter IMMOBI, then select IMMOBILIZER INFO.

   NOTE: If the HDS does not communicate with the immobilizer-keyless control unit, check the power, ground, and K-line connections.

   -4. Do the SYSTEM CHECK from the IMMOBILIZER INFO.

   Is N-1 OK indicated?

   YES

   Replace the gauge control module .

   NO

   Replace the immobilizer-keyless control unit .

KEYLESS ACCESS SYSTEM SYMPTOM TROUBLESHOOTING

All the doors will not lock and unlock

All the doors will not lock and unlock

1. Door lock actuator operation check 1

   -1. Put out all the keyless remotes from inside the vehicle, and close all doors and tailgate.

   -2. Press each LOCK and UNLOCK buttons of the keyless remote, at least ten times.

   Do the door lock actuators work normally?

   YES

   Go to step 2.

   NO

   Go to step 3.

2. Door lock actuator operation check 2

   -1. Lock and unlock the doors with touching the door outer handle.

Do the door lock actuators work normally?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connections.

NO

Go to symptom trouble shooting "The doors will not unlock or lock with the door outer handle touch sensors, but will unlock or lock with the keyless remote".

3. Determine possible failure area (keyless remote, others)

   -1. Press the LOCK and the UNLOCK buttons of the keyless remote, and check if the LED on the keyless remote comes on.

   Does the LED come on?

   YES

   Go to step 4.

   NO

   Replace the keyless remote battery and recheck the system. If the symptom does not go away, replace the keyless remote .

4. Door lock actuator operation check 2

   -1. Lock and unlock the doors with touching the door outer handle.

   Do the door lock actuators work normally?

   YES

   Register the keyless remote, and recheck. If the symptom does not go away, **replace the keyless remote** .

   NO

   Go to step 5.

5. Door lock actuator operation check 3

   -1. Lock and unlock the doors with the driver's door touch sensors.

   Do the door lock actuators work normally?

   YES

   Go to step 6.

   NO

   Check the B-CAN system DTCs. If not, check the door lock system.

6. Keyless access system check

   -1. **Do the keyless access remote check using the all keyless remotes** .

   Are the all keyless remotes OK?

YES

Do the SYSTEM CHECK 1 and SYSTEM CHECK 2 with the HDS. If the result is indicated, troubleshoot the items based on the SYSTEM CHECK table.

NO

Replace the keyless remote and recheck.

Cannot select ON mode with keyless access and with the keyless remote touching the engine start/stop switch

Cannot select ON mode with keyless access and with the keyless remote touching the engine start/stop switch

1. Keyless access system check 1

   -1. Do this procedure ten times: Turn the vehicle to the ON mode while turning the steering wheel to the left and to the right.

   Does the system change to ON mode?

   YES

   Intermittent failure, the system is OK at this time. Check for loose or poor connection.

   NO

   Go to step 2.

2. Keyless access system check 2

   -1. Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -2. Turn the vehicle to the ON mode while turning the steering wheel to the left and to the right.

   Does the system change to ON mode?

   YES

   Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access, but can select ON mode with the keyless remote touching the engine start/stop switch".

   NO

   Go to step 3.

3. Keyless access system check 3

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   Does the system communicate with the HDS?

   YES

   Go to step 4.

   NO

Go to step 11.

4. Keyless access system check 4

   -1. Reboot the HDS.

   -2. Select model on the HDS screen.

   -3. When prompted by the HDS, select YES when asked if the vehicle has keyless access system, then press and hold the engine start/stop switch for at least 2 minutes. This selects the forced ON mode.

   Does the system change to forced ON mode?

   YES

   Go to step 5.

   NO

   Go to step 16.

5. PCU DTC check

   -1. Check for PCU DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the PCU DTCs.

NO

Go to step 6.

6. Keyless access DTC check

   -1. Check for keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the keyless access control unit DTCs.

NO

Go to step 7.

7. Backup DTC check

   -1. Check for backup control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the backup control unit DTCs.

NO

Go to step 8.

8. Keyless access system check 5

-1. **Do the keyless access remote check using the all keyless remotes** .

Are the all keyless remotes OK?

YES

Go to step 9.

NO

Replace the keyless remote and recheck.

9. Keyless access system check 6

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove all the keyless remotes from inside the vehicle. Place the keyless remotes more than 1.5 m (5.0 ft) away from the vehicle.

-3. With electric steering lock: Disconnect the electric steering lock 12P connector.

-4. Reboot the HDS without pressing the engine start/stop switch.

-5. Do the registration of the body control module according to the instructions on the HDS screen.

-6. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, then select REPLACE PCU/BACKUP CONTROL/KEYLESS ACCESS CONTROL UNIT.

-7. With electric steering lock: Reconnect the electric steering lock 12P connector.

-8. Take the keyless remote into the vehicle, and clear the PCU DTCs with the HDS.

-9. Do this procedure ten times: Turn the vehicle to the ON mode while turning the steering wheel to the left and to the right.

Does the system change to ON mode?

YES

Intermittent failure, the system is OK at this time. Check for loose or poor connection.

NO

Go to step 10.

NO

Replace the body control module .

10. Body control module check (substitution)

    -1. **Substitute a known-good body control module** .

    -2. Do the registration of the body control module according to the instructions on the HDS screen.

    -3. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, then select REPLACE PCU/BACKUP CONTROL/KEYLESS ACCESS CONTROL UNIT.

    -4. Recheck the system.

    Is the system normal?

    YES

    Replace the original body control module .

    NO

    Replace the steering lock .

11. L-line check

    -1. **Do the DLC circuit troubleshooting** .

    Is L-line OK?

    YES

    Go to step 12.

    NO

    Repair an L-line wire circuit.

12. Engine start/stop switch operation check

    -1. **Do the engine start/stop switch test** .

    Is the engine start/stop switch OK?

    YES

    Go to step 13.

    NO

    Replace the engine start/stop switch .

13. Open wire check (SS1(+), SS2(-) lines)

    -1. Disconnect the following connectors.

Engine start/stop switch 10P connectorBody control module connector G (32P)

-2. Check for continuity between test points 1 and 2 respectively.

Test condition	Vehicle OFF (LOCK) modeEngine start/stop switch 10P connector: disconnectedBody control module connector G (32P): disconnected

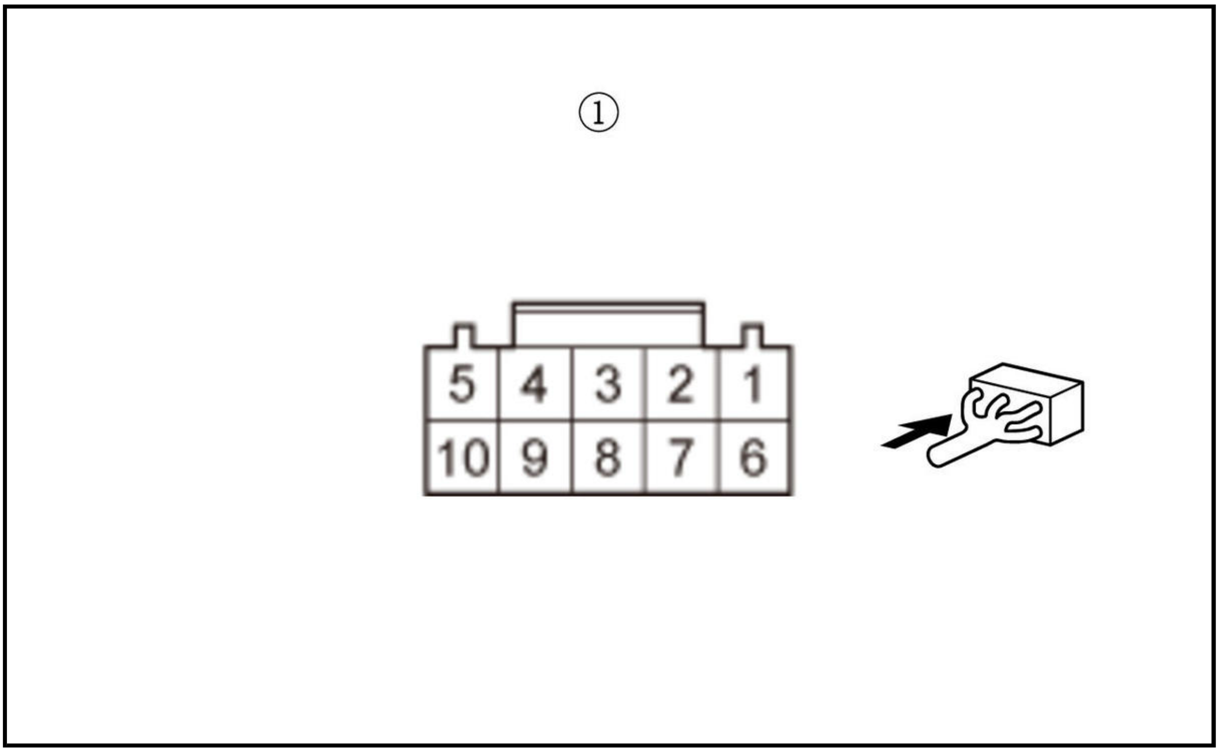
Test point 2	**Body control module connector G (32P) No. 9**



Is there continuity?

YES

The SS1(+) and SS2(-) wires are OK. Go to step 14.

NO

Repair an open or high resistance in the wire.

14. Open wire check (+B SMART line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeEngine start/stop switch 10P connector: disconnectedBody control module connector G (32P): disconnected
Test point 1	Engine start/stop switch 10P connector (female terminals) No. 5: ①

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

23. Body control module check (substitution)

-1. Substitute a known-good body control module .

-2. Reconnect these items:

Engine start/stop switch 10P connectorBody control module connector A (14P)Body control module connector B (36P)Body control module connector C (28P)Body control module connector F (36P)Body control module connector G (32P)Electric steering lock 12P connector

-3. Do the registration of the body control module according to the instructions on the HDS screen.

-4. Select REGISTRATION from the ONE-PUSH START system select menu with the HDS, then select REPLACE PCU/BACKUP CONTROL/KEYLESS ACCESS CONTROL UNIT.

-5. Turn the vehicle to the ON mode while turning the steering wheel to the left and to the right.

Does the system change to ON mode?

YES

Replace the original body control module .

NO

Replace the steering lock .

Cannot select ON mode with keyless access, but can select ON mode with the keyless remote touching the engine start/stop switch

1. Keyless access system check 1

   -1. Press the LOCK and the UNLOCK buttons of the keyless remote, and check if the LED on the keyless remote comes on.

   Does the LED come on?

   YES

   Go to step 2.

   NO

   Replace the keyless remote battery and recheck the system. If the symptom does not go away, replace the keyless remote .

2. Keyless access system check 2

   -1. Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -2. Turn the vehicle to the ON mode.

   -3. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   Does the system communicate with the HDS?

   YES

   Go to step 3.

   NO

   Do the input test for the body control module .

3. PCU DTC check

   -1. Check for PCU DTCs with the HDS.

DTC Description	DTC
B	B

   Are any DTCs indicated?

   YES

   Troubleshoot the PCU DTCs.

   NO

   Go to step 4.

4. Keyless access DTC check

-1. Check for keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the keyless access control unit DTCs.

NO

Go to step 5.

5. Backup DTC check

-1. Check for backup control unit DTCs with the HDS.

YES

The SS1(+) and SS2(-) wires are OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

8. Keyless access system check 4

-1. Do the keyless access remote check using the all keyless remotes .

Are the all keyless remotes OK?

YES

Replace the body control module .

NO

Replace the keyless remote and recheck.

Keyless access indicator does not go off or does not come on

Keyless access indicator does not go off or does not come on

1. Keyless access system check 1

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Turn the vehicle to the ON mode.

   -3. Check the keyless access indicator.

   Does the keyless access indicator come on for 2 seconds?

   YES

   Go to step 2.

   NO

   Do the gauge control module self-diagnostic function test . If the indicator does not come on, replace the gauge control module .

2. Keyless access system check 2

   -1. Check the keyless access indicator.

   Does the indicator blink once, then stay off?

   YES

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

   NO

   Go to step 3.

   Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 1 and 2.

2. Keyless access system check 2

   -1. With driver's power window open and all the doors closed, turn the vehicle to the OFF (LOCK) mode.

   -2. Remove all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

   -3. Press the engine start/stop switch. The MID should request the keyless remote to touch the engine start/stop switch. The LED on the engine start/stop switch will flash for up to 30 seconds.

   -4. Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you. The LED on the engine start/stop switch will turn solid when detected.

   -5. Turn the vehicle to the ON mode.

   -6. Select BACKUP CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.

   -7. Do the SYSTEM CHECK with the HDS.

   Is N-1 OK indicated?

   YES

Go to step 3.

NO

Troubleshoot the keyless access system according to the result of the SYSTEM CHECK.

3. Gauge control module check

   -1. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.

   Self diagnostic function - GAUGES

   Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

   Does the security indicator blinking?

   YES

   Go to the PGM-FI system troubleshooting.

   NO

   Replace the gauge control module .

The doors will not unlock or lock with the door outer handle touch sensors, but will unlock or lock with the keyless remote

The doors will not unlock or lock with the door outer handle touch sensors, but will unlock or lock with the keyless remote

NOTE: Before troubleshooting, make sure the BACK UP fuse in the under-hood fuse/relay box is OK.

1. Keyless access system check 1

   -1. Turn the vehicle to the ON mode.

   Does the system change to ON mode?

   YES

   Go to step 2.

   NO

   Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access and with the keyless remote touching the engine start/stop switch".

2. Keyless access DTC check

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SELF CHECK.

   One-Push - KEYLESS ACCESS CONTROL UNIT - SELF CHECK

   Check for keyless access control unit DTCs with the HDS.

DTC Description	DTC
B	B

Are any DTCs indicated?

YES

Troubleshoot the keyless access control unit DTCs.

NO

Go to step 3.

3. Keyless access system check 2

-1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

Select HISTORY CLEAR, and back to TEST MODE menu.

-3. Touch the each door outer handle touch sensors, then check the HISTORY DATA.

History Data

DRIVER DOOR UNLOCK SWITCH(OUTER HANDLE TOUCH SENSOR)	OK
FRONT PASSENGER DOOR UNLOCK SWITCH(OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Go to step 4.

NO

Go to step 6.

4. Keyless access system check 3

-1. Touch the each door outer handle lock sensors, then check the HISTORY DATA.

One-Push - KEYLESS ACCESS CONTROL UNIT - History data/Clear

History Data

DRIVER DOOR LOCK SWITCH(OUTER HANDLE TOUCH SENSOR)	OK
FRONT PASSENGER DOOR LOCK SWITCH(OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Go to step 5.

NO

Go to step 8.

5. Door lock actuator operation check

-1. Turn the vehicle to the OFF (LOCK) mode, and close all doors.

-2. Lock and unlock the doors with the driver's door touch sensors, and lock and unlock the doors with the front passenger's door touch sensors.

Do the door lock actuators work normally?

YES

Do the input test for the body control module , and do all power, ground, and communication input tests. If the body control module input tests prove OK, **replace the body control module** .

NO

Check the B-CAN system DTCs. If not, check the door lock system.

6. Door outer handle power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Each door outer handle 8P connector

-3. Measure the voltage between test points 1 and 2 respectively.

Driver's door

Test condition	Vehicle OFF (LOCK) modeDriver's door outer handle 8P connector: disconnected

FRONT PASSENGER DOOR LOCK SWITCH(OUTER HANDLE TOUCH SENSOR)	OK

Is all the information OK?

YES

Replace the faulty door outer handle .

NO

Go to step 14.

8. Door outer handle power circuit check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Each door outer handle 8P connector

-3. Measure the voltage between test points 1 and 2 respectively.

Driver's door

Test condition	Vehicle OFF (LOCK) modeDriver's door outer handle 8P connector: disconnected

Is there continuity?

YES

The GND wires are OK. Go to step 11.

NO

Repair an open or high resistance in the ground wire or poor ground (G401, G402).

11. Open wire check (VOUT FR DR, VOUT FR AS lines)

-1. Disconnect the following connector.

Body control module connector G (32P)

-2. Check for continuity between test points 1 and 2 respectively.

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The VOUT FR DR and VOUT FR AS wires are OK. Go to step 13.

13. Open wire check (+B BACK UP line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeEach door outer handle 8P connectors: disconnectedBody control module connector C (28P): disconnectedBody control module connector G (32P): disconnected
Test point 1	**Body control module connector C (28P) No. 27**

Is there battery voltage?

YES

The +B BACK UP wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

14. Open wire check (TS FR DR, TS FR AS lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector G (32P)

-3. Check for continuity between test points 1 and 2 respectively.

YES

The +B BACK UP wire is OK. Replace the body control module .

NO

Repair an open or high resistance in the wire.

16. Open wire check (DL FR DR, DL FR AS lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wires from the door outer handle connectors.

-3. Disconnect the following connector.

Body control module connector G (32P)

-4. Check for continuity between test points 1 and 2 respectively.

NO

Repair an open or high resistance in the wire.

The doors will not unlock or lock with the keyless remote, but will unlock or lock with the door outer handles

The doors will not unlock or lock with the keyless remote, but will unlock or lock with the door outer handles

1. Door lock actuator operation check 1

   -1. Put out all the keyless remotes from inside the vehicle, and close all doors and tailgate.

   -2. Press each LOCK and UNLOCK buttons of the keyless remote, at least ten times.

   Do the door lock actuators work normally?

   YES

   Intermittent failure, the system is OK at this time. Check for loose or poor connections.

   NO

   Go to step 2.

2. Keyless access system check 1

   -1. Open the driver's door.

   Does the key-in reminder sound?

   YES

   Replace the body control module .

   NO

   Go to step 3.

3. Keyless access system check 2

   -1. Turn the vehicle to the ON mode.

   Does the system change to ON mode?

   YES

   Go to step 5.

   NO

   Go to step 4.

4. Keyless access system check 3

   -1. With driver's power window open and all of the doors closed, turn the vehicle to the OFF (LOCK) mode.

   -2. Put out all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

   -3. Press the engine start/stop switch. The MID should request the keyless remote to touch the engine start/stop switch. The LED on the engine start/stop switch will flash for up to 30 seconds.

   -4. Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you.

   Does the system change to ON mode?

YES

Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access, but can select ON mode with the keyless remote touching the engine start/stop switch".

NO

Go to keyless access system symptom troubleshooting "Cannot select ON mode with keyless access and with the keyless remote touching the engine start/stop switch".

5. PCU and keyless access DTC check

-1. Check for PCU and keyless access control unit DTCs with the HDS.

6. Determine possible failure area (keyless remote, others)

-1. **Do the keyless access remote check using the all keyless remotes** .

Are the all keyless remotes OK?

YES

Go to step 7.

NO

Replace the keyless remote and recheck.

7. Door lock actuator operation check 2

-1. Turn the vehicle to the OFF (LOCK) mode, and close all doors.

-2. Lock and unlock the doors with the driver's door touch sensors, and lock and unlock the doors with the front passenger's door touch sensors.

Do the door lock actuators work normally?

YES

Do the input test for the body control module , and do all power, ground, and communication input tests. If the body control module input tests prove OK, **replace the body control module** .

NO

Check the B-CAN system DTCs. If not, check the door lock system.

1. Keyless access system check 1

   -1. Check the security indicator.

   Does the security indicator blinking?

   YES

   Go to step 2.

   NO

   Go to step 5.

2. Keyless access system check 2

   -1. Select KEYLESS ACCESS CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter KEYLESS ACCESS SYSTEM INFORMATION.

   One-Push - BACKUP CONTROL UNIT - SYSTEM CHECK

   Do the SYSTEM CHECK 1 and 2 with the HDS.

   Are N-1 OK and N-2 OK indicated?

   YES

   Go to step 3.

   YES

   Go to step 6.

   NO

   Troubleshoot the keyless access system according to the result of the SYSTEM CHECK 1 and 2.

3. Keyless access system check 3

   -1. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Electrical Steering Lock SWITCH B	B	B

   Is the indicator ON?

   YES

   Go to step 6.

   NO

   Go to step 4.

4. Open wire check (ESL SW B line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Body control module connector G (32P)Electric steering lock 12P connector

-3. Check for continuity between test points 1 and 2.

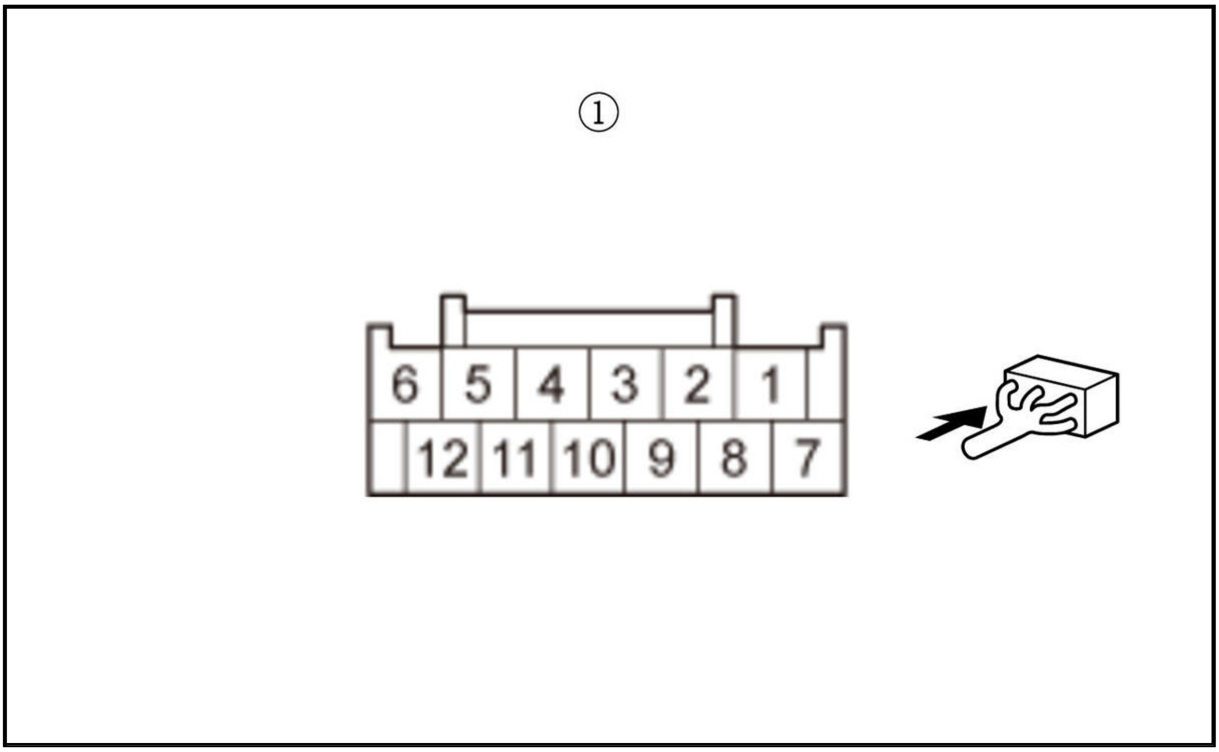
Test point 2	**Body control module connector G (32P) No. 3**



Is there continuity?

YES

The ESL SW B wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

5. Gauge control module check

-1. Select GAUGES from the BODY ELECTRICAL SYSTEM SELECT menu with the HDS.

Self diagnostic function - GAUGES

Select FUNCTIONAL TESTS from the TEST MODE menu with the HDS, and enter SELF TEST.

Does the security indicator blinking?

YES

Go to the PGM-FI system troubleshooting.

NO

Replace the gauge control module .

6. Keyless access system check 4

   -1. With driver's power window open and all of the doors closed, turn the vehicle to the OFF (LOCK) mode.

   -2. Put out all the keyless remotes from inside the vehicle. Hold them outside the open driver's window, at least 20 cm (8.0 in) away from the vehicle.

   -3. Press the engine start/stop switch. The MID should request the keyless remote to touch the engine start/stop switch. The LED on the engine start/stop switch will flash for up to 30 seconds.

   -4. Touch the engine start/stop switch with the keyless remote. The buttons on the keyless remote should be facing you.

   -5. Try to start the engine.

   Does the engine start?

   YES

   Go to step 7.

   NO

   Go to step 8.

7. PGM-FI DTC check

   -1. Check for PGM-FI DTCs with the HDS.

DTC Description	Confirmed DTC	Pending DTC
B	B	B

   Are any DTCs indicated?

   YES

   Troubleshoot the PGM-FI DTCs.

   NO

   Replace the body control module .

8. Keyless access system check 5

   -1. Select BACKUP CONTROL UNIT from the ONE-PUSH START system select menu with the HDS, and enter SYSTEM INFORMATION.

Is there continuity?

YES

The R SIDE DOOR LOCK wire is OK. Go to step 9.

NO

Repair an open or high resistance in the wire.

9. Open wire check (DOOR UNLOCK RELAY CL- line)

-1. Disconnect the following connectors.

Body control module connector B (36P)Under-dash fuse/relay box connector F (12P)

-2. Check for continuity between test points 1 and 2.

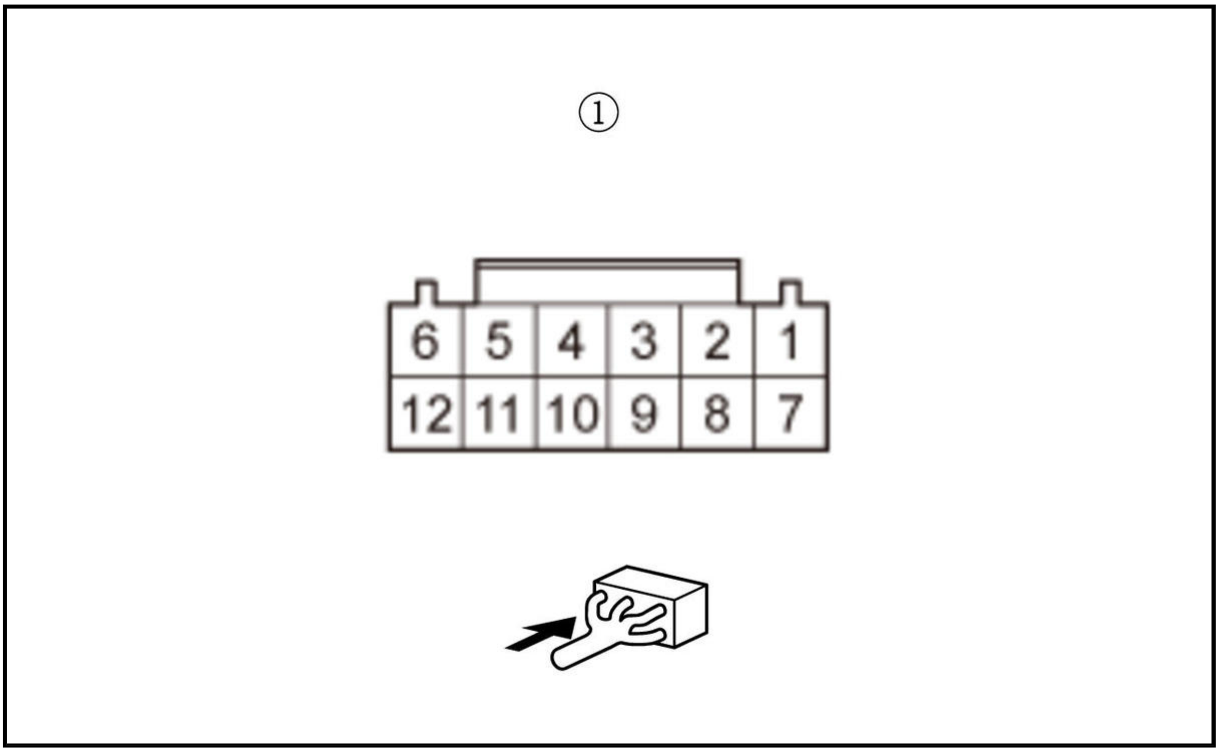
Test point 2	Under-dash fuse/relay box connector F (12P) (female terminals) No. 5: ①



Is there continuity?

YES

The DOOR UNLOCK RELAY CL- wire is OK. **Replace the body control module** .

NO

Repair an open or high resistance in the wire.

10. Determine possible failure area (left rear door lock actuator, others)

-1. Disconnect the following connector.

Left rear door latch 10P connector

-2. **Test the left rear door lock actuator**.

Is the door lock actuator OK?

YES

Go to step 11.

NO

Faulty door lock actuator; **replace the left rear door latch** .

11. Open wire check (L SIDE DOOR UNLOCK line)

-1. Disconnect the following connector.

Under-dash fuse/relay box connector B (22P)

-2. Check for continuity between test points 1 and 2.

Driver's Rear Door Lock Knob Switch(UNLOCK)	B	B
Passenger's Rear Door Lock Knob Sw. (UNLOCK)	B	B

Is each switch information OK?

YES

Replace the body control module .

NO

Driver's door switch circuit: go to step 19.

NO

Driver's door lock knob switch circuit: go to step 21.

NO

Front passenger's door lock knob switch circuit: go to step 27.

NO

Left rear door lock knob switch circuit: go to step 33.

NO

Right rear door lock knob switch circuit: go to step 39.

19. Driver's door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the driver's door switch.

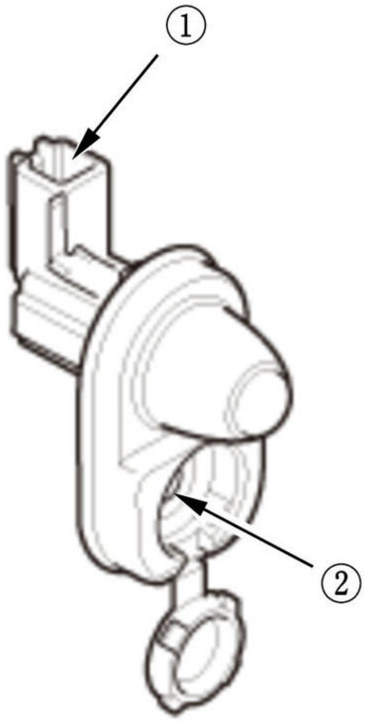
-3. Disconnect the following connector.

Driver's door switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test point 1	Driver's door switch 1P connector: ①

Test point 2	Switch ground: ②



Is there no continuity when you press the switch and is there continuity when you release the switch?

YES

Go to step 20.

NO

Replace the driver's door switch.

20. Shorted wire check (FL DOOR SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector D (40P): disconnectedDriver's door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 22**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The FL DOOR SW wire is OK. **Replace the body control module** .

21. Keyless/power door locks/security system check 1

-1. With the driver's door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Go to step 22.

NO

Go to step 24.

22. Determine possible failure area (driver's door lock knob switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value OFF?

YES

Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Go to step 23.

23. Shorted wire check (DR SILCON UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnectedPower window master switch 37P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**

Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The DR SILCON UNLOCK wire is OK. **Replace the power window master switch** .

24. Keyless/power door locks/security system check 2

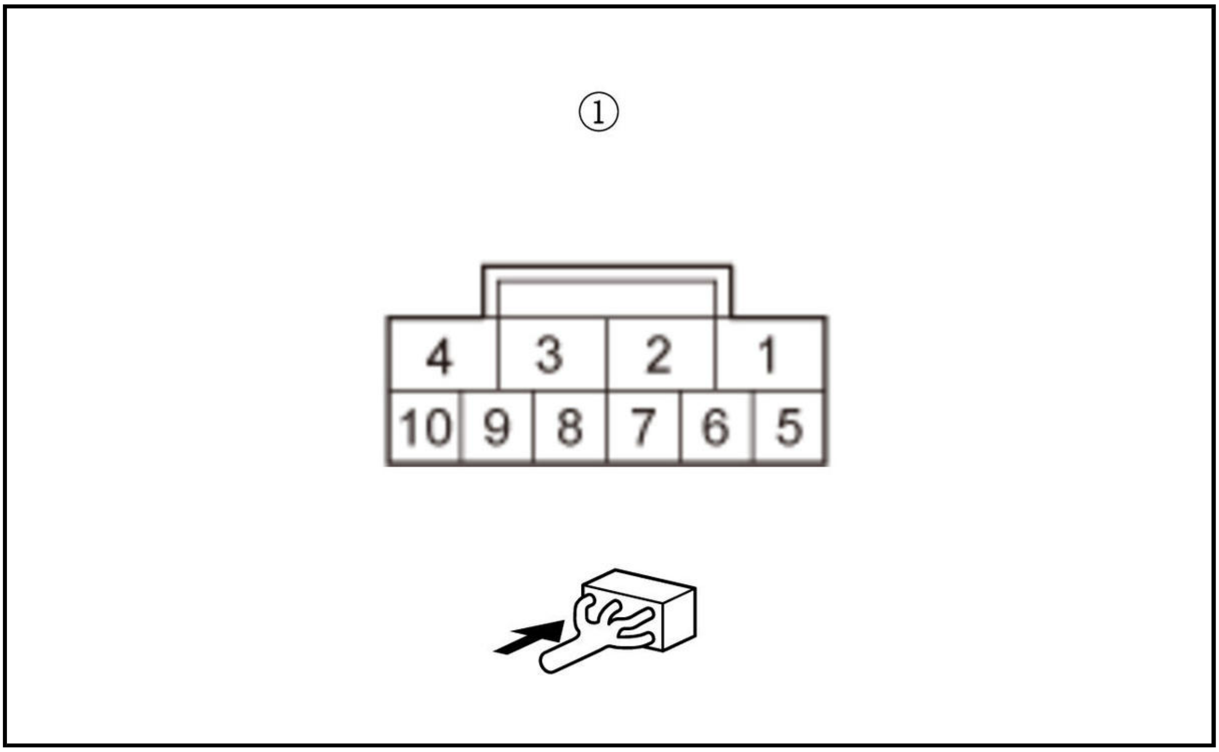
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door latch 10P connector (female terminals) No. 5: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Go to step 25.

NO

Go to step 26.

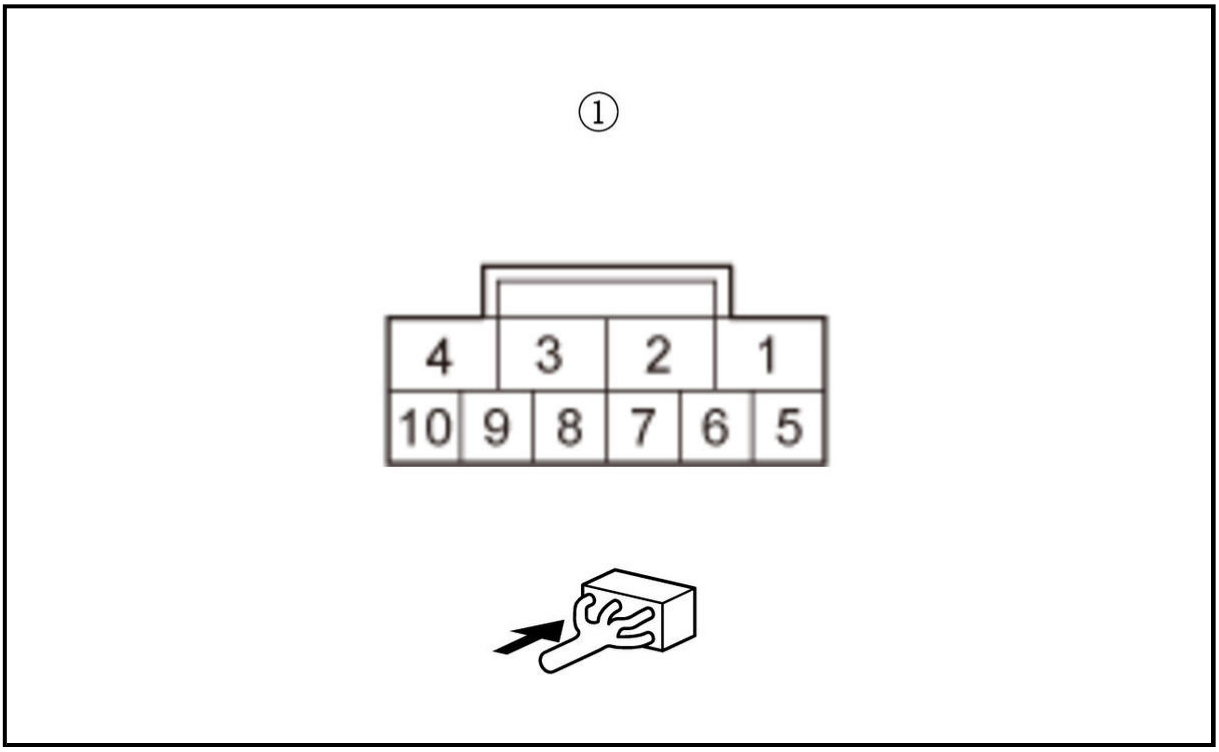
25. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnected
Test point 1	Driver's door latch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Repair an open or high resistance in the wire or poor ground (G401).

26. Open wire check (DR SILCON UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 20**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The DR SILCON UNLOCK wire is OK. **Replace the power window master switch** .

27. Keyless/power door locks/security system check 1

-1. With the front passenger's door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch(UNLOCK)	B	B

Is information indicator ON?

YES

Go to step 28.

NO

Go to step 30.

28. Determine possible failure area (front passenger's door lock knob switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch(UNLOCK)	B	B

Is information value OFF?

YES

Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

NO

Go to step 29.

29. Shorted wire check (AS SILCON UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's power window switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's door latch 10P connector: disconnectedFront passenger's power window switch 37P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 36**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The AS SILCON UNLOCK wire is OK. **Replace the front passenger's power window switch** .

30. Keyless/power door locks/security system check 2

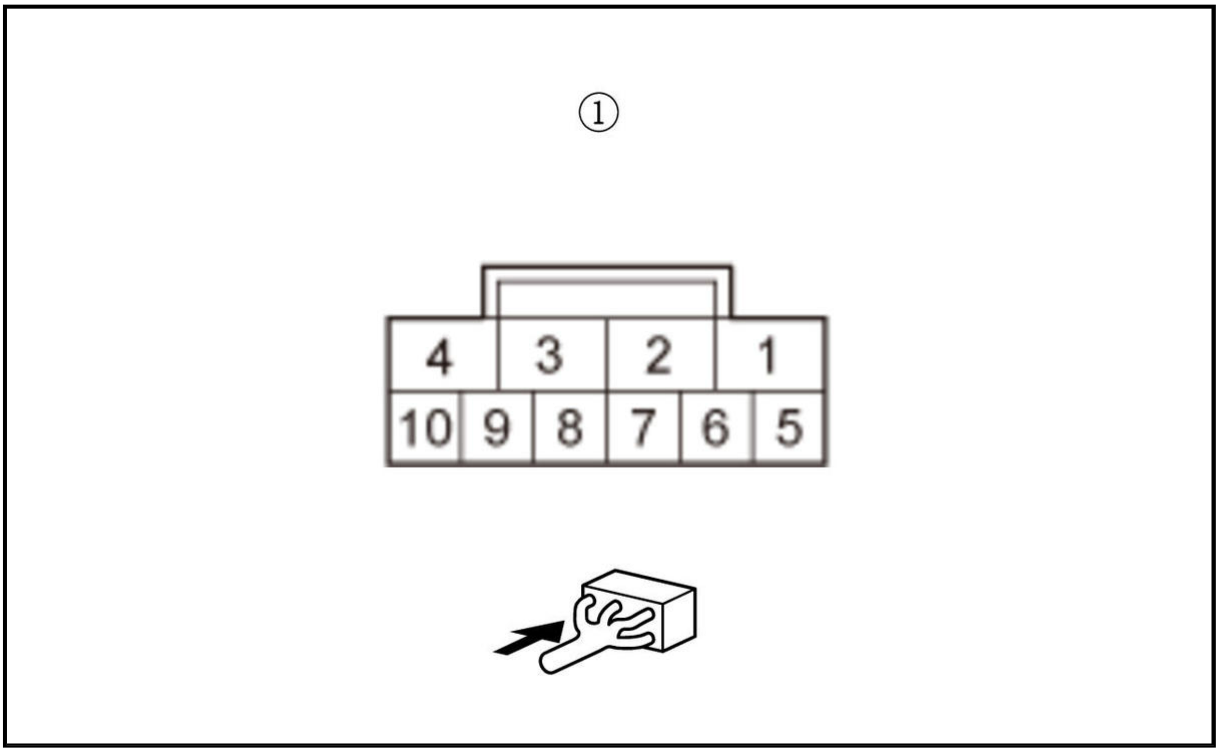
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Front passenger's door latch 10P connector (female terminals) No. 10: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Go to step 31.

NO

Go to step 32.

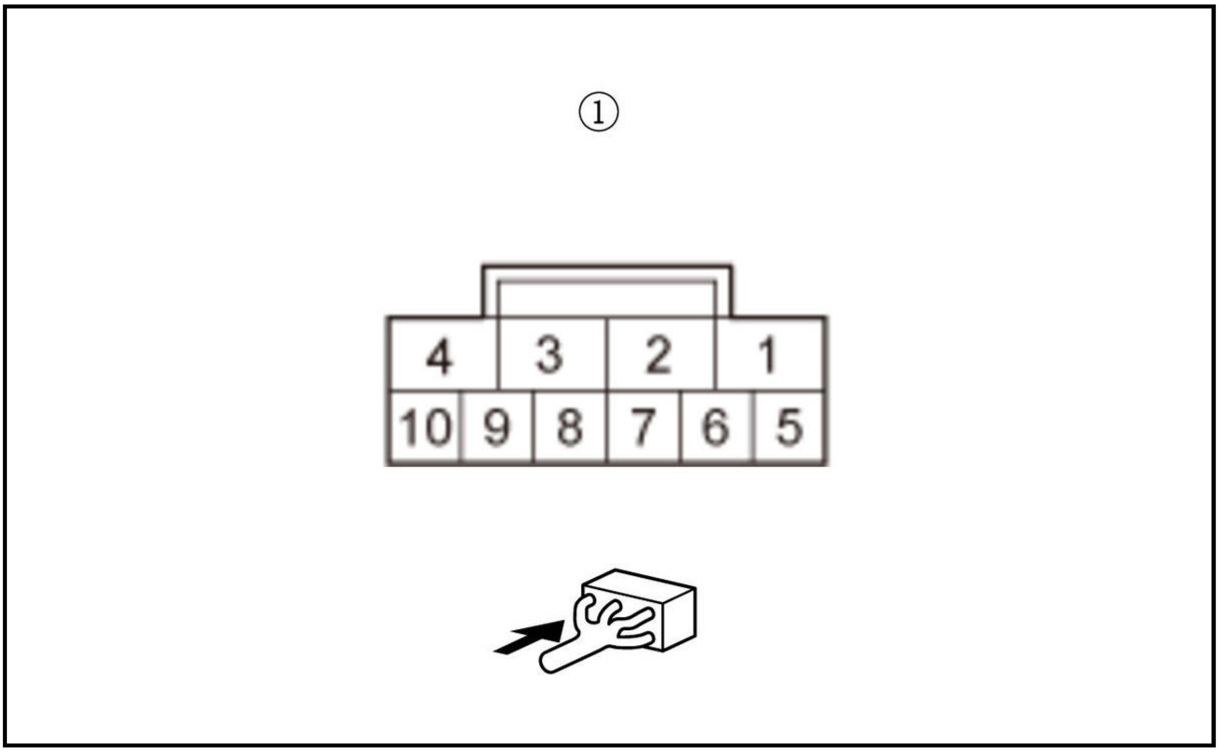
31. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's door latch 10P connector: disconnected
Test point 1	Front passenger's door latch 10P connector (female terminals) No. 8: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

32. Open wire check (AS SILCON UNLOCK line)

    -1. Remove the jumper wire.

    -2. Connect terminals A and B with a jumper wire.

Terminal A	**Front passenger's power window switch 37P connector No. 36**
Terminal B	Body ground

    -3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The AS SILCON UNLOCK wire is OK. **Replace the front passenger's power window switch** .

33. Keyless/power door locks/security system check 1

    -1. With the left rear door lock knob switch in UNLOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit

Is information value ON?

YES

Go to step 34.

NO

Go to step 36.

34. Determine possible failure area (left rear door lock knob switch, others)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the following connector.

Left rear door latch 10P connector

    -3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Lock Knob Switch(UNLOCK)	B	B

Is information value OFF?

YES

Faulty left rear door lock knob switch; **replace the left rear door latch** .

NO

Go to step 35.

35. Shorted wire check (RR L SILCON UNLOCK line)

-1. Disconnect the following connector.

Body control module connector C (28P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector C (28P): disconnectedLeft rear door latch 10P connector: disconnected
Test point 1	**Body control module connector C (28P) No. 15**

2. Keyless/power door locks/security system check 1

-1. With the power tailgate closed, check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Go to step 3.

NO

Go to step 5.

3. Determine possible failure area (full latch switch, others)

-1. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Trunk Lid/Tailgate Switch	B	B

Is information value OFF?

YES

Faulty power tailgate full latch switch; replace the power tailgate closer unit .

NO

Go to step 4.

4. Shorted wire check (T/G SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector D (40P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modePower tailgate closer unit connector B (6P): disconnectedBody control module connector D (40P): disconnected
Test point 1	**Body control module connector D (40P) No. 27**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The T/G SW wire is OK. Faulty body control module; replace the body control module .

5. Keyless/power door locks/security system check 2

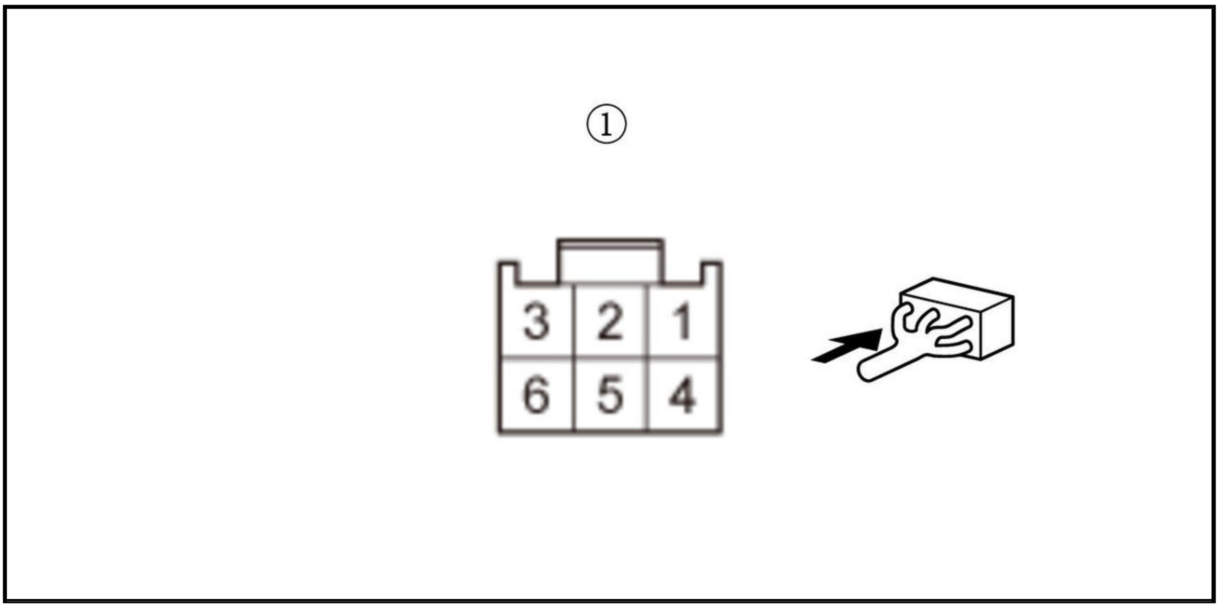
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power tailgate closer unit connector B (6P)

-3. Connect terminals A and B with a jumper wire.

Terminal A	Power tailgate closer unit connector B (6P) (female terminals) No. 1: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Go to step 6.

NO

Go to step 8.

6. Open wire check (PTG/PTL SEG3 line)

-1. Turn the vehicle to the OFF (LOCK) mode.

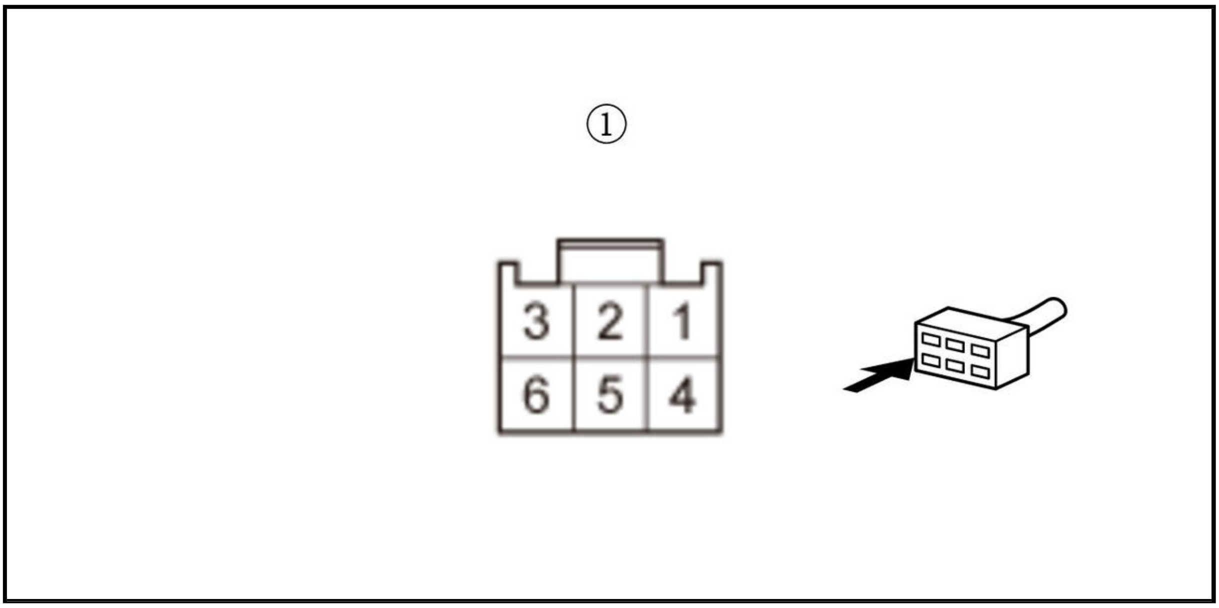
-2. Remove the jumper wire.

-3. Disconnect the following connector.

Power tailgate control unit connector A (24P)

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modePower tailgate closer unit connector B (6P): disconnectedPower tailgate control unit connector A (24P): disconnected
Test point 1	Power tailgate closer unit connector B (6P) (female terminals) No. 2: ①
Test point 2	**Power tailgate control unit connector A (24P) No. 21**



Is there continuity?

YES

Go to step 7.

NO

Repair an open or high resistance in the wire.

7. Power Tailgate Latch/Ratchet Switch check

-1. Do the Power Tailgate Latch/Ratchet Switch test

Is the switch OK?

YES

Replace the power tailgate control unit .

NO

Replace the power tailgate closer unit .

8. Open wire check (T/G SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector D (40P) No. 27**
Terminal B	Body ground

-4. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The T/G SW wire is OK. Faulty body control module; **replace the body control module** .

9. Keyless/power door locks/security system check 1

-1. With the tailgate closed, check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Go to step 10.

NO

Go to step 12.

10. Determine possible failure area (tailgate latch switch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Tailgate latch 4P connector

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Trunk Lid/Tailgate Switch	B	B

Is information value OFF?

YES

Faulty tailgate latch switch; **replace the tailgate latch** .

NO

Go to step 11.

11. Shorted wire check (T/G SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Body control module connector D (40P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector D (40P): disconnectedTailgate latch 4P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 27**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The T/G SW wire is OK. Faulty body control module; **replace the body control module** .

12. Keyless/power door locks/security system check 2

-1. Turn the vehicle to the OFF (LOCK) mode.

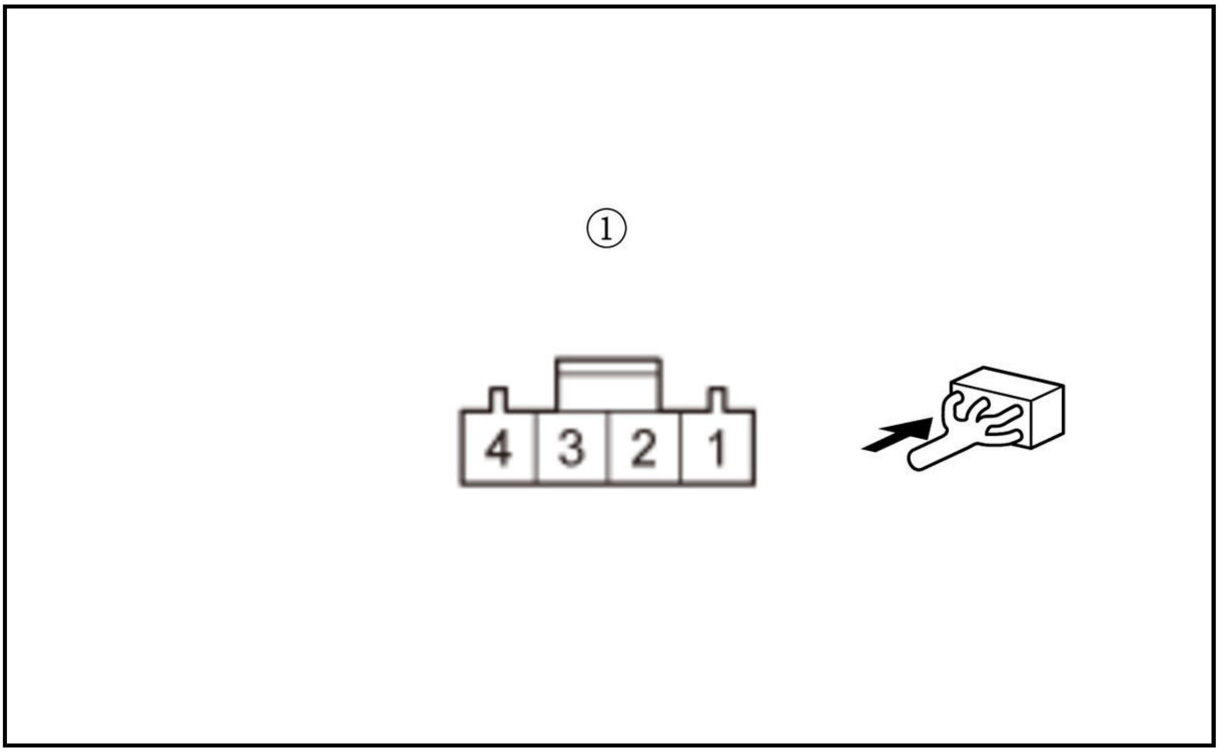
-2. Disconnect the following connector.

Tailgate latch 4P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Tailgate latch 4P connector (female terminals) No. 1: ①

Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Go to step 13.

NO

Go to step 14.

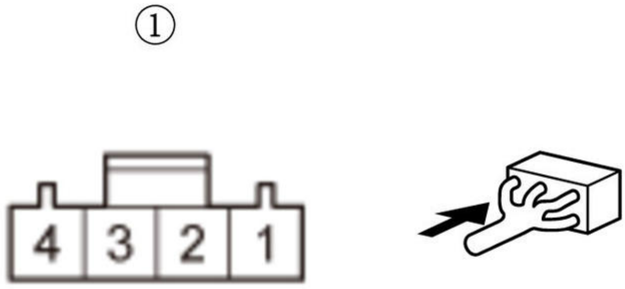
13. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeTailgate latch 4P connector: disconnected
Test point 1	Tailgate latch 4P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Faulty tailgate latch switch; **replace the tailgate latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G505).

14. Open wire check (T/G SW line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Body control module connector D (40P) No. 27
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Trunk Lid/Tailgate Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The T/G SW wire is OK. Faulty body control module; **replace the body control module** .

15. Keyless/power door locks/security system check 1

-1. With the hood opened, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Security Hood Switch	B	B

Is information value OFF?

YES

Go to step 16.

NO

Go to step 18.

16. Determine possible failure area (hood latch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Hood latch switch 2P connector

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Security Hood Switch	B	B

Is information value ON?

YES

Faulty hood latch switch; **replace the hood latch** .

NO

Go to step 17.

17. Shorted wire check (HOOD SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay control module connector A (6P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeRelay control module connector A (6P): disconnectedHood latch switch 2P connector: disconnected

Test point 1	**Relay control module connector A (6P) No. 5**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The HOOD SW wire is OK. Faulty relay control module; **replace the relay control module** .

18. Keyless/power door locks/security system check 2

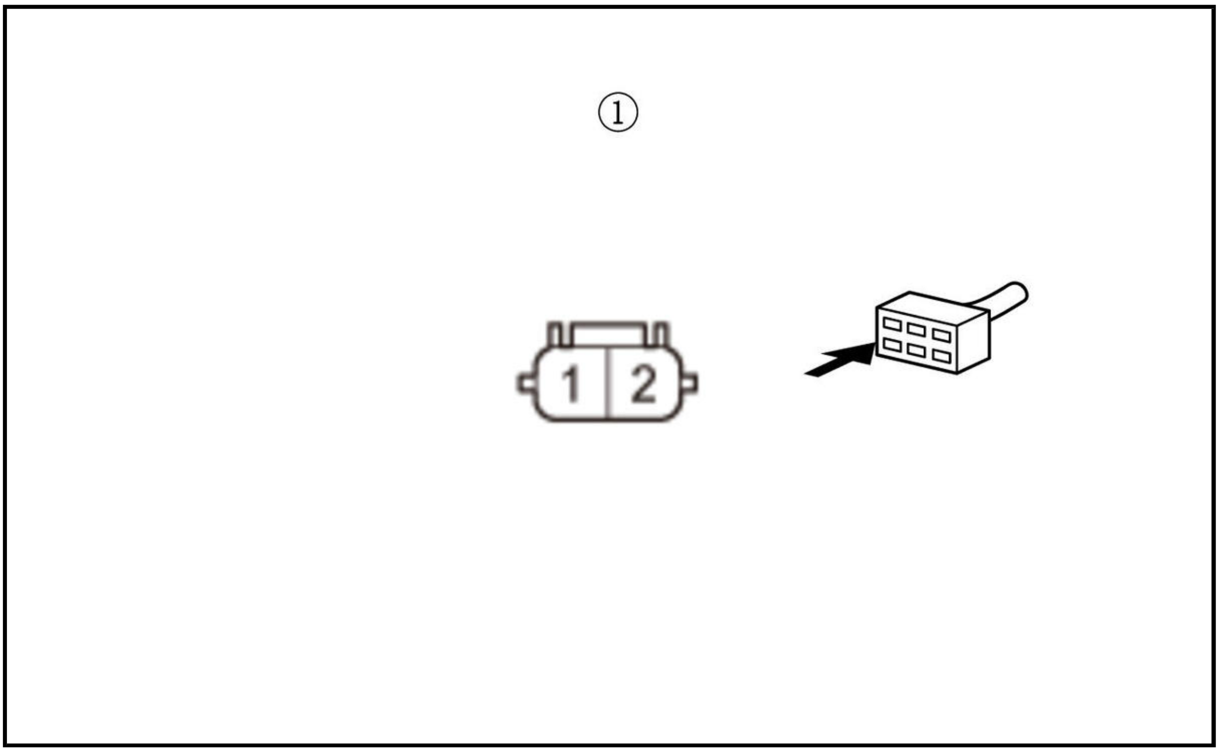
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Hood latch switch 2P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Hood latch switch 2P connector (female terminals) No. 1: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Security Hood Switch	B	B

Is information value OFF?

YES

Go to step 19.

NO

Go to step 20.

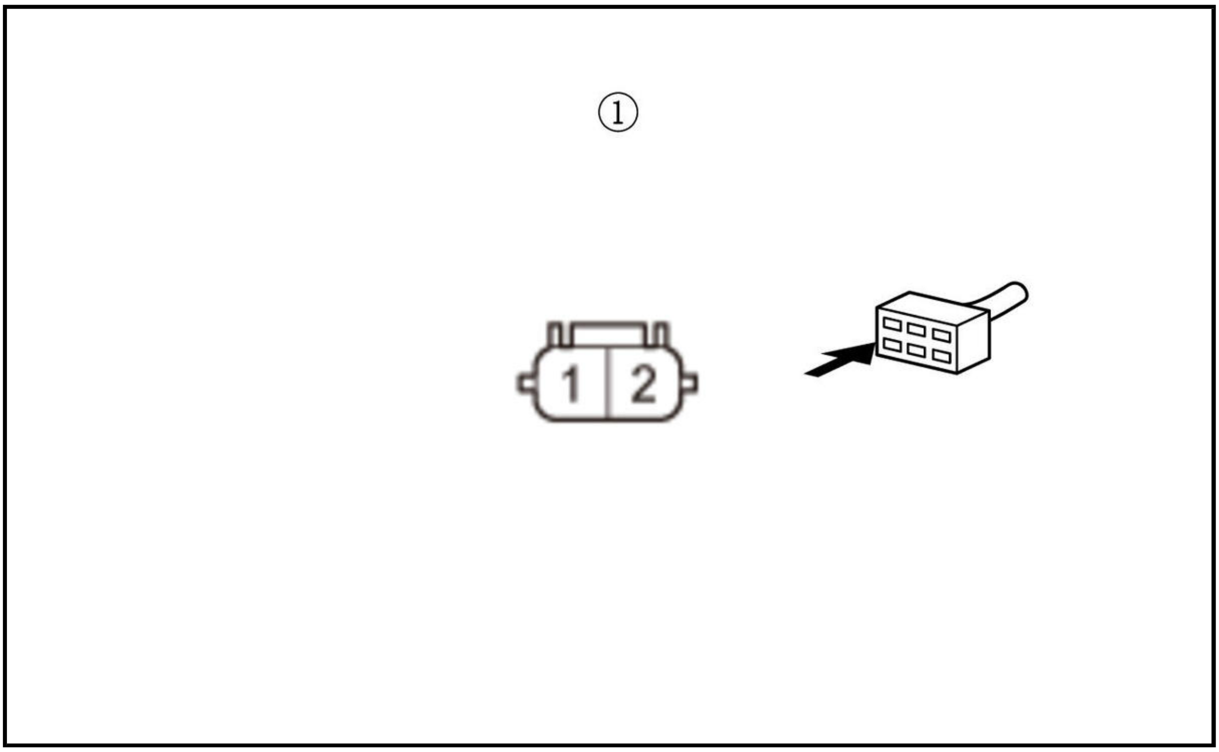
19. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeHood latch switch 2P connector: disconnected
Test point 1	Hood latch switch 2P connector (female terminals) No. 2: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Faulty hood latch switch; **replace the hood latch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G251).

20. Open wire check (HOOD SW line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	**Relay control module connector A (6P) No. 5**
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Security Hood Switch	B	B

Is information value OFF?

YES

Repair an open or high resistance in the wire.

NO

The HOOD SW wire is OK. Faulty relay control module; **replace the relay control module** .

21. Keyless/power door locks/security system check 1

-1. With the driver's door lock knob switch in LOCK position, check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Go to step 22.

NO

Go to step 24.

22. Determine possible failure area (driver's door latch, others)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value OFF?

YES

Faulty driver's door lock knob switch; **replace the driver's door latch** .

NO

Go to step 23.

23. Shorted wire check (DR SILCON UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Power window master switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modePower window master switch 37P connector: disconnectedDriver's door latch 10P connector: disconnected
Test point 1	**Power window master switch 37P connector No. 20**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The DR SILCON UNLOCK wire is OK. **Replace the power window master switch** .

24. Keyless/power door locks/security system check 2

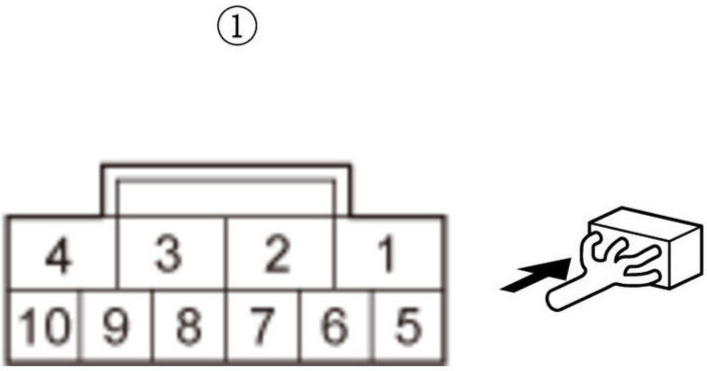
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door latch 10P connector (female terminals) No. 5: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions

Is information value ON?

YES

Go to step 25.

NO

Go to step 26.

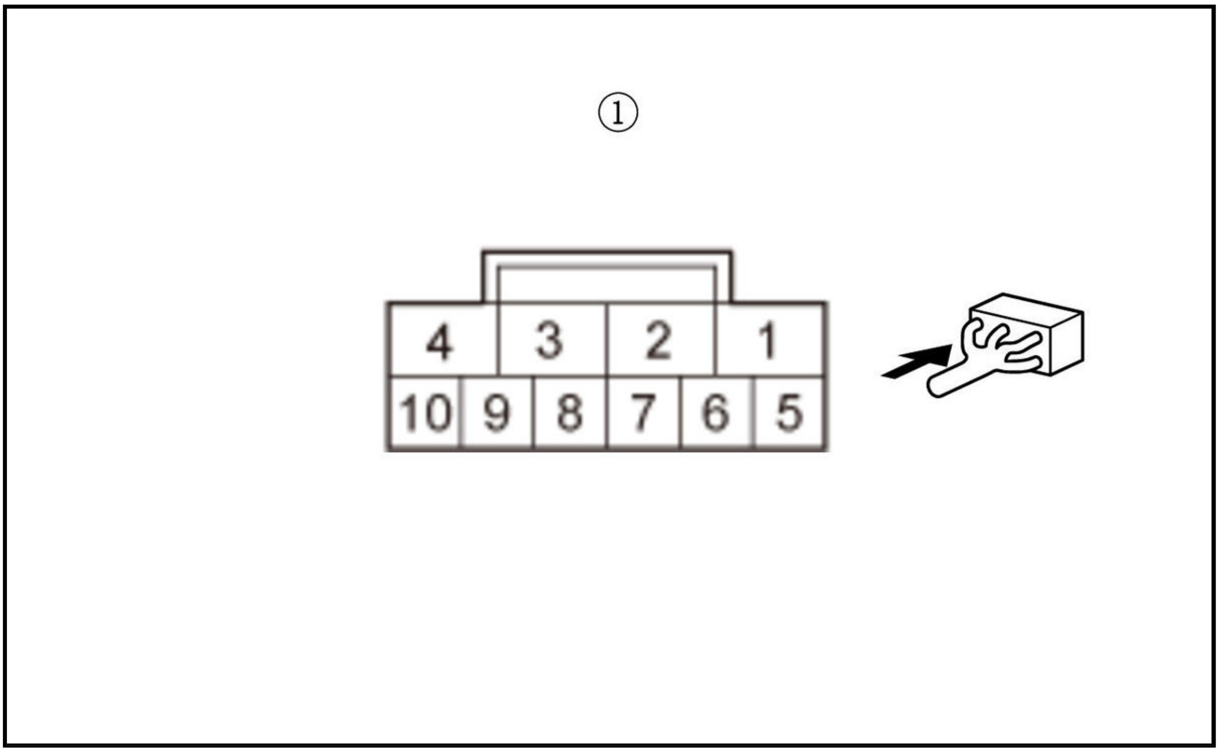
25. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Remove the jumper wire.

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnected
Test point 1	Driver's door latch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. Faulty driver's door lock knob switch; replace the driver's door latch .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

26. Open wire check (DR SILCON UNLOCK line)

-1. Remove the jumper wire.

-2. Connect terminals A and B with a jumper wire.

Terminal A	Power window master switch 37P connector No. 20
Terminal B	Body ground

-3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Door Lock Knob Switch(UNLOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The DR SILCON UNLOCK wire is OK. **Replace the power window master switch** .

27. Keyless/power door locks/security system check 1

    -1. With the front passenger's door lock knob switch in LOCK position, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch(UNLOCK)	B	B

    Is information value ON?

    YES

    Go to step 28.

    NO

    Go to step 30.

28. Determine possible failure area (front passenger's door latch, others)

    -1. Turn the vehicle to the OFF (LOCK) mode.

    -2. Disconnect the following connector.

Front passenger's door latch 10P connector

    -3. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Door Lock Knob Switch(UNLOCK)	B	B

    Is information value OFF?

    YES

    Faulty front passenger's door lock knob switch; **replace the front passenger's door latch** .

    NO

    Go to step 29.

29. Shorted wire check (AS SILCON UNLOCK line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Front passenger's power window switch 37P connector

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeFront passenger's power window switch 37P connector: disconnectedFront passenger's door latch 10P connector: disconnected
Test point 1	**Front passenger's power window switch 37P connector No. 36**

Is there no continuity when you press the switch and is there continuity when you release the switch?

YES

Go to step 54.

NO

Replace the front passenger's door switch.

54. Open wire check (FR DOOR SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector D (40P) No. 23**

Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Front Passenger's Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The FR DOOR SW wire is OK. Faulty body control module; **replace the body control module** .

55. Keyless/power door locks/security system check

-1. With the left rear door closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Switch	B	B

Is information value ON?

YES

Go to step 56.

NO

Go to step 58.

56. Left rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

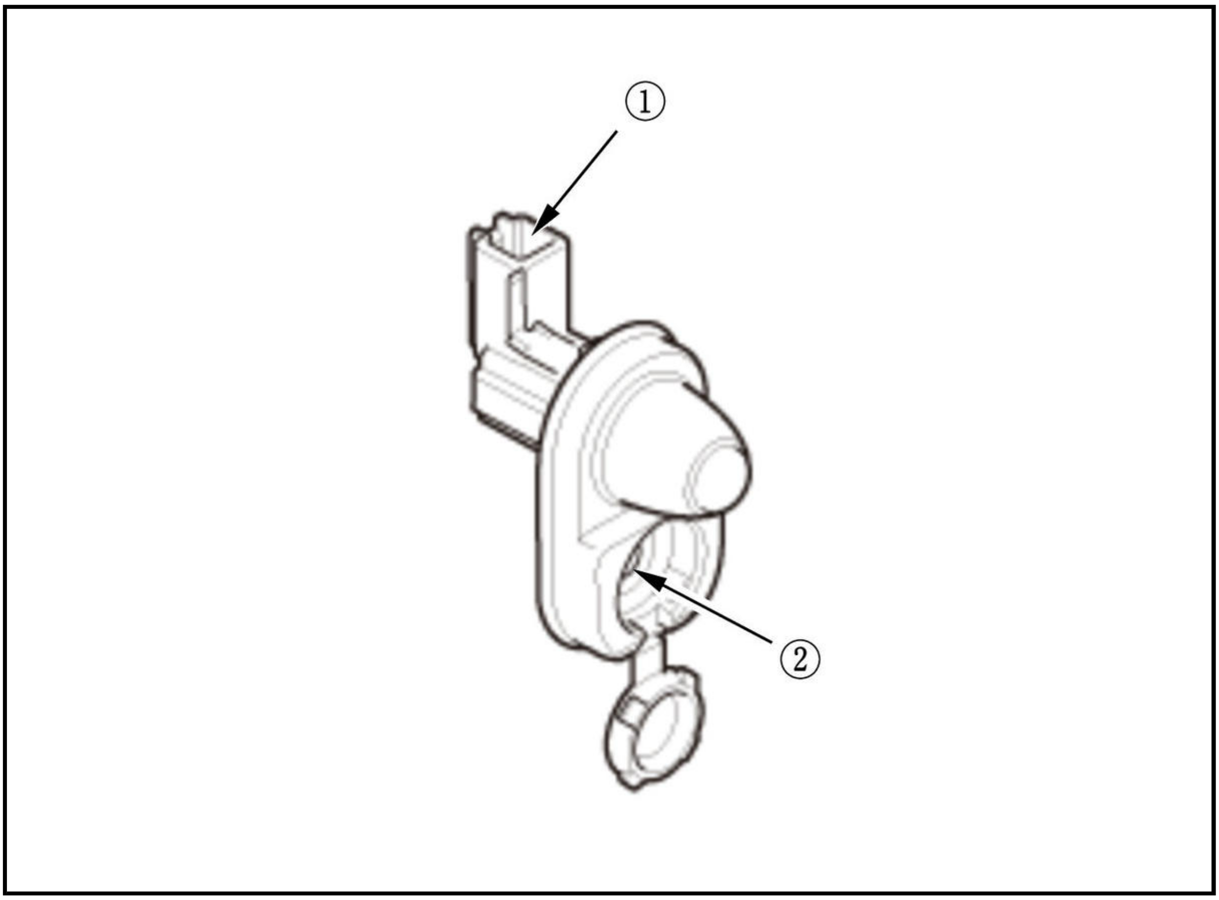
-2. Remove the left rear door switch.

-3. Disconnect the following connector.

Left rear door switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test point 1	Left rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there no continuity when you press the switch and is there continuity when you release the switch?

YES

Go to step 57.

NO

Replace the left rear door switch.

57. Shorted wire check (RL DOOR SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector D (40P): disconnectedLeft rear door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 24**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The RL DOOR SW wire is OK. Faulty body control module; **replace the body control module** .

58. Left rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

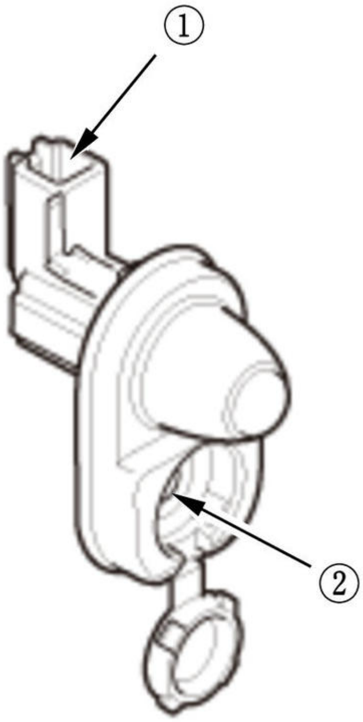
-2. Remove the left rear door switch.

-3. Disconnect the following connector.

Left rear door switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test point 1	Left rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there no continuity when you press the switch and is there continuity when you release the switch?

YES

Go to step 59.

NO

Replace the left rear door switch.

59. Open wire check (RL DOOR SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector D (40P) No. 24**

Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Driver's Rear Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RL DOOR SW wire is OK. Faulty body control module; **replace the body control module** .

60. Keyless/power door locks/security system check

-1. With the right rear door closed, check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Switch	B	B

Is information value ON?

YES

Go to step 61.

NO

Go to step 63.

61. Right rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

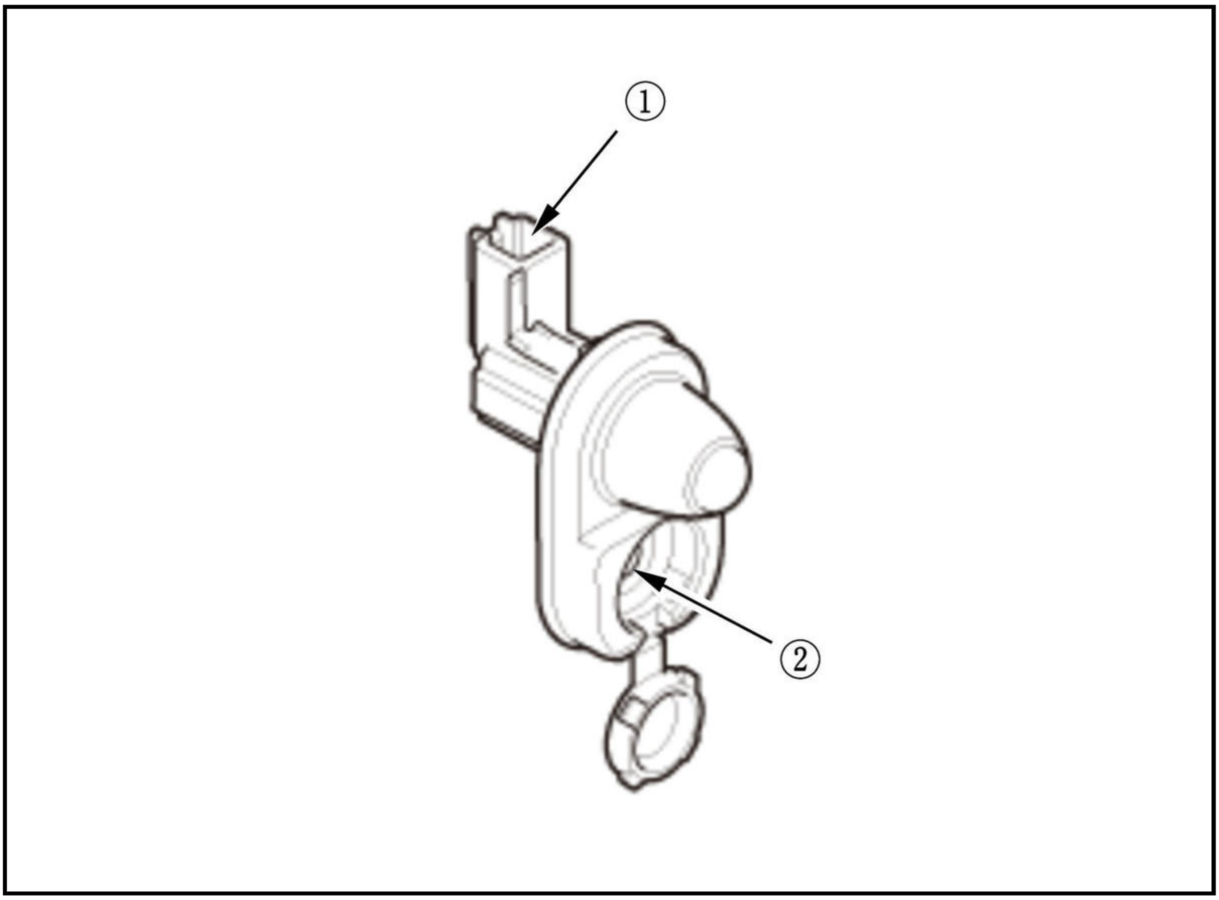
-2. Remove the right rear door switch.

-3. Disconnect the following connector.

Right rear door switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test point 1	Right rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there no continuity when you press the switch and is there continuity when you release the switch?

YES

Go to step 62.

NO

Replace the right rear door switch.

62. Shorted wire check (RR DOOR SW line)

-1. Disconnect the following connector.

Body control module connector D (40P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeBody control module connector D (40P): disconnectedRight rear door switch 1P connector: disconnected
Test point 1	**Body control module connector D (40P) No. 28**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire.

NO

The RL DOOR SW wire is OK. Faulty body control module; **replace the body control module** .

63. Right rear door switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

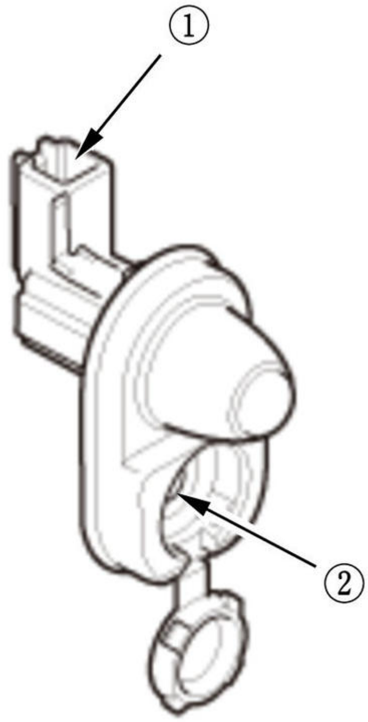
-2. Remove the right rear door switch.

-3. Disconnect the following connector.

Right rear door switch 1P connector

-4. Check for continuity between test points 1 and 2.

Test point 1	Right rear door switch 1P connector: ①
Test point 2	Switch ground: ②



Is there no continuity when you press the switch and is there continuity when you release the switch?

YES

Go to step 64.

NO

Replace the right rear door switch.

64. Open wire check (RR DOOR SW line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Body control module connector D (40P) No. 28**

Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	Unit
Passenger's Rear Door Switch	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The RR DOOR SW wire is OK. Faulty body control module; **replace the body control module** .

65. Keyless/power door locks/security system check

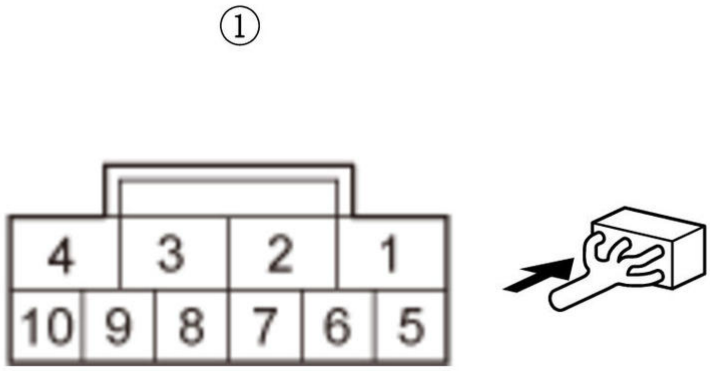
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Driver's door latch 10P connector

-3. Connect terminals A and B with a jumper wire.

Terminal A	Driver's door latch 10P connector (female terminals) No. 9: ①
Terminal B	Body ground



-4. Check the parameter(s) below with the HDS.

Signal	Current conditions	
	Value	**Unit**
Driver's Door Key Cylinder Switch(LOCK)	B	B

Is information value ON?

YES

Go to step 66.

NO

Go to step 68.

66. Driver's door key cylinder switch operation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Test the driver's door key cylinder switch**.

Is the switch OK?

YES

Go to step 67.

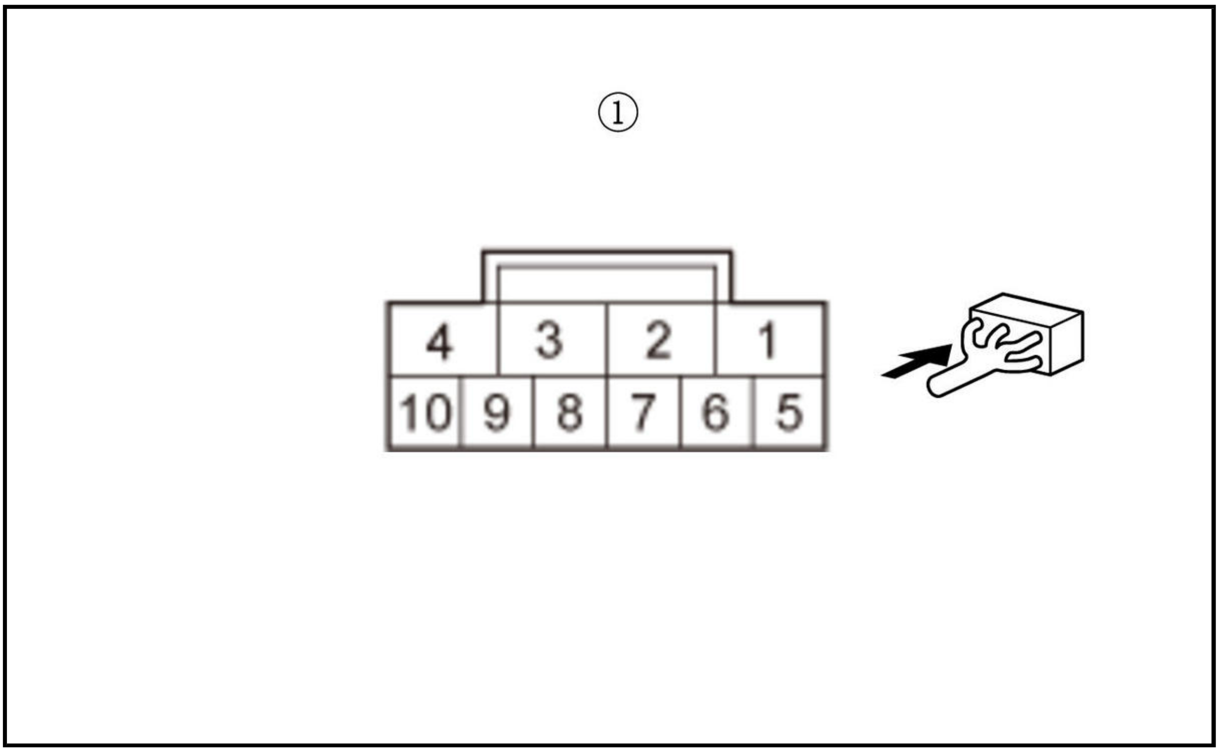
NO

Faulty driver's door key cylinder switch; **replace the driver's door latch** .

67. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) modeDriver's door latch 10P connector: disconnected
Test point 1	Driver's door latch 10P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there continuity?

YES

The GND wire is OK. **Replace the power window master switch** .

NO

Repair an open or high resistance in the ground wire or poor ground (G401).

68. Open wire check (DR KEY CYL LOCK line)

-1. Connect terminals A and B with a jumper wire.

Terminal A	**Power window master switch 37P connector No. 7**
Terminal B	Body ground

-2. Check the parameter(s) below with the HDS.

Signal	**Current conditions**	
	Value	**Unit**
Driver's Door Key Cylinder Switch(LOCK)	B	B

Is information value ON?

YES

Repair an open or high resistance in the wire.

NO

The DR KEY CYL LOCK wire is OK. **Replace the power window master switch** .

- Unless otherwise indicated, illustration shows left of the vehicle; right of the vehicle is symmetrical.

1. Rear Bumper - Remove
2. BSI Radar Unit - Remove

	1. Disconnect the connector (A). 2. Remove the BSI radar unit assembly (B).

	3. If necessary, remove the BSI radar unit (A) from the bracket (B).

3. All Removed Parts - Install

1. Install the parts in the reverse order of removal.

4. **BSI Radar Unit Aiming - Inspect**
5. **Rear Bumper - Install**

REMOVAL AND INSTALLATION

QUARTER GLASS REMOVAL AND INSTALLATION

Removal

1. Quarter Pillar Trim - Remove
2. Quarter Glass - Remove

	1. Remove the front seal (A) from the front edge of the quarter glass (B). If necessary, cut the front seal with a utility knife.

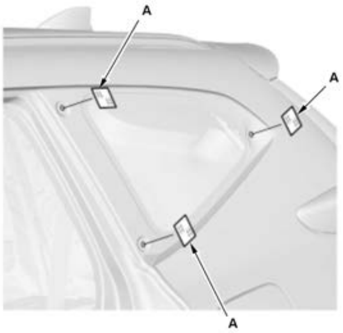
	2. If the original quarter glass (A) will be reinstalled, make alignment marks (B) across the glass and the body with a grease pencil over the quarter glass molding (C).

	3. Apply protective tape along the inside and outside edges of the body. From the pillar side of the vehicle, to cut the adhesive (A) with a utility knife (B).

	4. Pass a piano wire (A) from the inside of the vehicle at the place where the corner portion of the quarter glass ends, and wrap each end around a piece of wood. 5. Pull the piano wire back and forth in a sawing motion. 6. Repeat these procedure, cut through the rubber dam and the adhesive (B) of the quarter glass. **NOTE:** - If the quarter glass will be reinstalled, take care not to damage the molding. - If the molding is damaged, replace the quarter glass, the molding, and the clips as an assembly. 7. Carefully remove the quarter glass with suction cups. 8. If a new quarter glass will be installed, remove the clips from the body. 9. Scrape the original adhesive smooth to a thickness of about 1 mm (0.04 in) - 2 mm (0.08 in) on the bonding surface around the entire quarter glass opening flange with a putty knife. **NOTE:** Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.

Installation

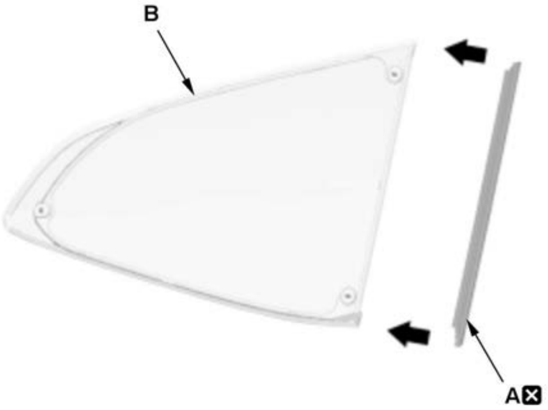
1. Quarter Glass - Install



1. Clean the body bonding surface with a shop towel dampened with isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface.

2. If you are reinstalling the original quarter glass, scrape off the original adhesive from the quarter glass with a putty knife. Clean the bonding surfaces on the inside face and the edge of the quarter glass with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil, and grease.

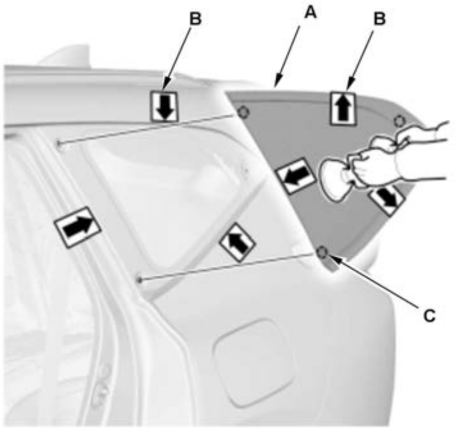
3. If the original quarter glass will be reinstalled (and either clip is broken off the molding), seal the body holes with pieces of urethane tapes (A).



4. Install the front seal (A) with adhesive tape to the inside face of the quarter glass (B) as shown.

NOTE:

- Before installing the front seal, apply primer to the inside face of the quarter glass.
- Be careful not to touch the quarter glass where the adhesive will be applied.



5. Set the quarter glass (A) in the opening, and make alignment marks (B) across the quarter glass and the body with a grease pencil at the three points shown.

NOTE:

- Make sure the clips (C) contact with the edge of the body holes.
- Be careful not to touch the quarter glass where the adhesive will be applied.

6. Apply a light coat of primer to the quarter glass (A) along the edge of the front seal (B) and the quarter glass molding (C) as shown, then lightly wipe it off with gauze or cheesecloth.

NOTE:

- Apply the primer to the rear corner, upper corner, and lower corner areas of the quarter glass using the printed dots (D) on the quarter glass as a guide.
- Do not apply body primer to the quarter glass, and do not mix up the body and the glass primer applicators.
- Never touch the primed surfaces with your hands. If you do, adhesive may not bond to the quarter glass properly, causing a leak after the quarter glass is installed.
- Keep water, dust, and abrasive materials away from the primed surfaces.

Lightly push on the quarter glass until its edges are fully seated on the adhesive all the way around. **NOTE:** Do not open or close any of the doors for about an hour until the adhesive is dry. 11. Remove the excess adhesive with a putty knife or a shop towel dampened with isopropyl alcohol. 12. Wait at least an hour for the adhesive to dry, then spray water over the quarter glass and check for leaks. Mark the leaking areas, let the quarter glass dry, then seal with sealant. Let the vehicle stand for at least 4 hours after quarter glass installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly. 13. Advise the customer not to do the following things for 2 to 3 days: • Slam the doors with all the windows rolled up. • Twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

REAR WINDOW REMOVAL AND INSTALLATION

Removal

1. Tailgate Spoiler Trim - Remove
2. Tailgate Trim - Remove
3. Rear Window Wiper Motor - Remove
4. Rear Window - Remove

	1. Disconnect the connectors (A).

	2. Remove the rear windshield corner moldings (A) from the corner of the rear window (B). If necessary, cut the rear windshield corner moldings with a utility knife.

 **Cutting positions** 	3. Apply protective tape along the inside and the outside edges of the tailgate. Make a hole with an awl through the adhesive from inside of the vehicle at the corner portion of the rear window. Push a piece of piano wire through the hole, and wrap each end around a piece of wood. 4. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the rear window (B) as possible to prevent damage to the tailgate, and carefully cut through the adhesive (C) around the entire rear window. 5. Carefully remove the rear window. 6. Scrape the original adhesive smooth to a thickness of about 1 mm (0.04 in) - 2 mm (0.08 in) on the bonding surface around the entire rear window opening flange with a knife. **NOTE:** • Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding. • Remove the fasteners from the body. 7. Clean the body bonding surface with a shop towel dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface. 8. If you are reinstalling the original rear window, scrape off all of the original adhesive, the fasteners, and the rubber dams from the rear window with a putty knife. Clean the bonding surface on the inside face and the edge of the rear window with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil, and grease.

Installation

1. Rear Window - Install

1. Clean the body bonding surface with a shop towel dampened with isopropyl alcohol. After cleaning, do not allow oil, grease, and water to contact on the clean surface.

2. If you are reinstalling the original rear window, scrape off the original adhesive, the fasteners, and the rubber dam from the rear window with a putty knife. Clean the bonding surface on the inside face and the edge of the rear window with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil, and grease.

3. Install the fasteners (A) with the adhesive tape to the inside face of the rear window (B) as shown.

NOTE:

- Be careful not to touch the rear window where the adhesive will be applied.
- Before installing the spacer and the fasteners, apply glass primer to the area where the adhesive tape will be applied.
- Make sure the spacer and the fasteners line up with the alignment marks (C).

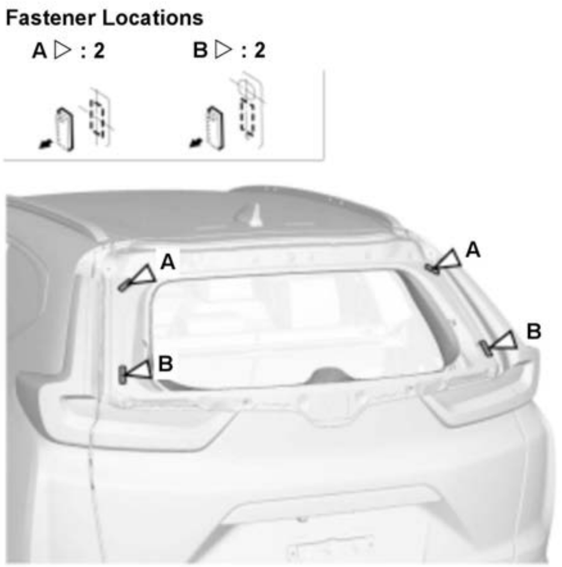
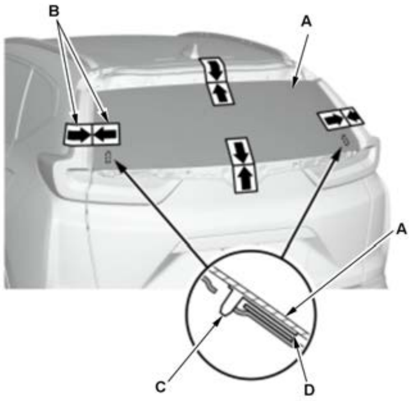
NOTE:

- After installing the new rubber dam, cut the both ends of rubber dam flush with the edges of the glass as shown.
- Be careful not to touch the rear window where the adhesive will be applied.



8. Attach the fasteners (A, B) with the adhesive tape to the rear window opening flange of the tailgate as shown.



9. If you are installing the new rear window (A), set the rear window in the opening, and center it. Make the alignment marks (B) across the rear window and the body with a grease pencil at the four points shown.

NOTE:

- Be careful not to touch the rear window where the adhesive will be applied.
- Make sure the pins (C) of the fasteners (D) contact with the edge of the body holes.

10. Remove the rear window.

11. Apply a light coat of primer to the rear window (A) along the edge of the rubber dams (B) as shown, then lightly wipe it off with gauze or cheesecloth.

- Apply the primer to the rear window using the printed dots (C) on the rear window as a guide.
- Do not apply body primer to the rear window, and do not mix up the body and the glass primer applicators.
- Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the rear window properly, causing a leak after the rear window is installed.
- Keep water, dust, and abrasive materials away from primed surfaces.

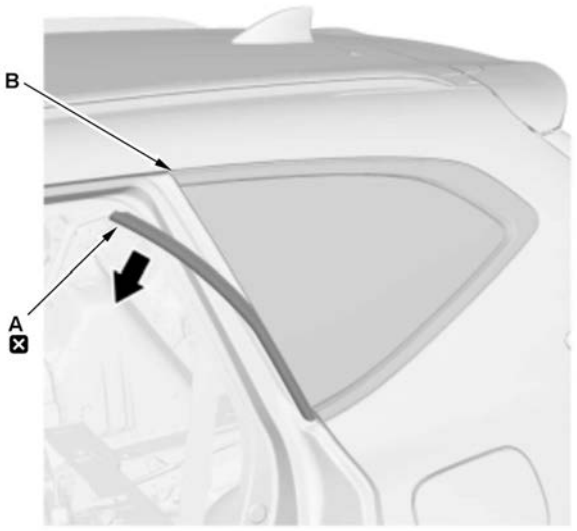
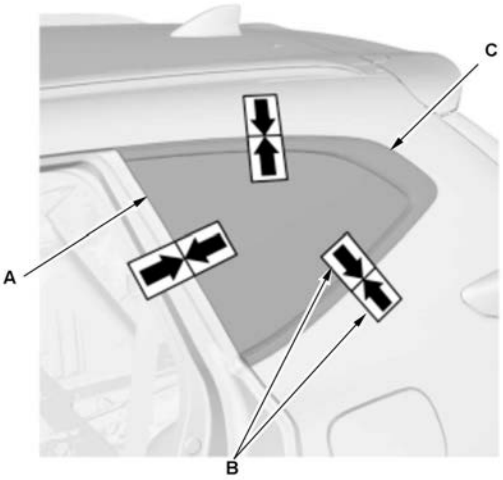
QUARTER GLASS REMOVAL AND INSTALLATION

Removal

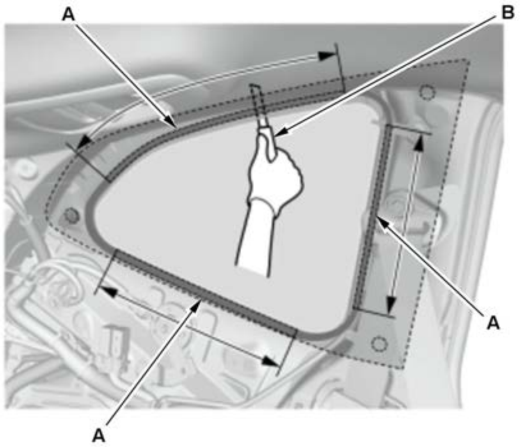
1. Quarter Pillar Trim - Remove
2. Quarter Glass - Remove



1. Remove the front seal (A) from the front edge of the quarter glass (B). If necessary, cut the front seal with a utility knife.



2. If the original quarter glass (A) will be reinstalled, make alignment marks (B) across the glass and the body with a grease pencil over the quarter glass molding (C).



3. Apply protective tape along the inside and outside edges of the body. From the pillar side of the vehicle, to cut the adhesive (A) with a utility knife (B).

	4. Pass a piano wire (A) from the inside of the vehicle at the place where the corner portion of the quarter glass ends, and wrap each end around a piece of wood. 5. Pull the piano wire back and forth in a sawing motion. 6. Repeat these procedure, cut through the rubber dam and the adhesive (B) of the quarter glass. **NOTE:** • If the quarter glass will be reinstalled, take care not to damage the molding. • If the molding is damaged, replace the quarter glass, the molding, and the clips as an assembly. 7. Carefully remove the quarter glass with suction cups. 8. If a new quarter glass will be installed, remove the clips from the body. 9. Scrape the original adhesive smooth to a thickness of about 1 mm (0.04 in) - 2 mm (0.08 in) on the bonding surface around the entire quarter glass opening flange with a putty knife. **NOTE:** Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding.

Installation

1. Quarter Glass - Install

	1. Clean the body bonding surface with a shop towel dampened with isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the surface. 2. 2. If you are reinstalling the original rear window, scrape off the original adhesive, the fasteners, and the rubber dam from the rear window with a putty knife. Clean the bonding surface on the inside face and the edge of the rear window with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil, and grease.

3. Install the spacer (A) or the fasteners (B) with the adhesive tape to the inside face of the rear window (C) as shown.

NOTE:

- Be careful not to touch the rear window where the adhesive will be applied.
- Before installing the spacer and the fasteners, apply glass primer to the area where the adhesive tape will be applied.
- Make sure the spacer and the fasteners line up with the alignment marks (D).

- Apply the glass primer to the rear window using the printed dots (C) on the rear window as a guide.
- Do not apply body primer to the rear window, and do not mix up the body and glass primer applicators.
- Never touch the primed surfaces with your hands. If you do, the adhesive may not bond to the rear window properly, causing a leak after the rear window is installed.
- Keep water, dust, and abrasive materials away from primed surfaces.

15. Hold the rear window with suction cups over the opening, align it with the alignment marks you made in step 6, and set it down on the adhesive. Lightly push on the rear window until its edges are fully seated on the adhesive all the way around.

NOTE: Do not open or close any of the doors for about an hour until the adhesive is dry.

16. Remove the excess adhesive with a putty knife or a shop towel dampened with isopropyl alcohol.

17. Wait at least an hour for the adhesive to dry, then spray water over the rear window and check for leaks. Mark the leaking areas, let the rear window dry, then seal with sealant. Let the vehicle stand for at least 4 hours after rear window installation. If the vehicle has to be used within the first 4 hours, it must be driven slowly.

18. Advise the client not to do the following things for 2 to 3 days:

- Do not slam the doors with all the windows rolled up.
- Do not twist the body excessively (such as when going in and out of driveways at an angle or driving over rough, uneven roads).

	3. If the original windshield will be reinstalled, make alignment marks (A) across the glass and the body with a grease pencil.

 *1: Heated windshield wiper area harness type 1 *2: Heated windshield wiper area harness type 2 **Cutting positions** 	4. Apply protective tape along the edge of the dashboard and the body. Make a hole with an awl through the rubber dam, the adhesive, and the dashboard seal from inside of the vehicle at a corner portion of the windshield. Push a piece of piano wire through the hole, and wrap each end around a piece of wood. 5. With a helper on the outside, pull the piano wire (A) back and forth in a sawing motion. Hold the piano wire as close to the windshield (B) as possible to prevent damage to the body and the dashboard. Carefully cut through the rubber dam and the adhesive (C) around the entire windshield. 6. Carefully remove the windshield. 7. Scrape the original adhesive smooth to a thickness of about 1 mm (0.04 in) - 2 mm (0.08 in) on the bonding surface around the entire windshield opening flange with a knife: **NOTE:** • Do not scrape down to the painted surface of the body; damaged paint will interfere with proper bonding. • Remove the rubber dams, the dashboard seal, and the fasteners from the body. 8. Clean the body bonding surface with a shop towel dampened in isopropyl alcohol. After cleaning, keep oil, grease, and water from getting on the clean surface. 9. If you are reinstalling the original windshield, scrape off all of the original adhesive, the clips, the dashboard seal, and the rubber dam from the windshield with a putty knife. Clean the boning surface on the inside face and the edge of the windshield with isopropyl alcohol. Make sure the bonding surface is kept free of water, oil, and grease.

DESCRIPTION & OPERATION

POWER WINDOWS SYSTEM DESCRIPTION

Basic Control/Function

- Manual Up/Down Function

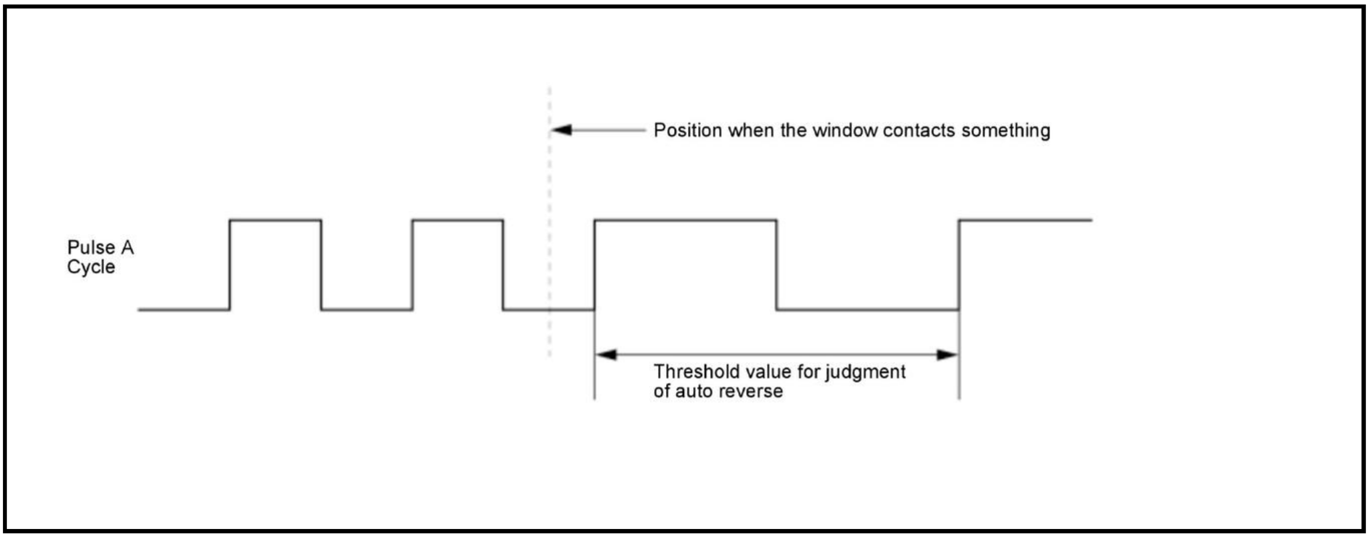
  The 1-step operation of the power window switch moves the window up or down. This is available during the vehicle in the ON mode or the vehicle OFF operation.

- Auto Up/Down Function

  The 2-step operation of the power window switch moves the window up or down. This is available during the vehicle in the ON mode or the vehicle OFF operation.

Auto Reverse Power Window Function

When an object is detected during the auto up operation, the window stops closing and reverses about 70 mm (2.76 in). If the window is less than halfway opened (about 220 mm (8.66 in)), it will reverse to the half open position (about 220 mm (8.66 in)). In manual operation, this function is active only during the vehicle OFF operation. This function is activated based on the calculation of the rotation speed and load change of the motor's pulse A.



Position when the window contacts something

Vehicle OFF Operation

For about 10 minutes after the vehicle is turned to the OFF (LOCK) mode, the window's open/close operation with the power window switches is available.

Keyless/Key Cylinder Operation

By turning the key a second time and holding it with the key inserted into the driver's door key cylinder, the windows and moonroof close (or open) (turning the key clockwise to open, turning the key counterclockwise to close). The windows and moonroof stop moving when the key is returned to the neutral position.

By pressing and holding the UNLOCK button of the remote a second time, the windows and moonroof open. The windows and moonroof stop moving when the UNLOCK button is released. For some models, by pressing and holding the LOCK button of the remote a second time, the windows and moonroof close. The windows and moonroof stop moving when the LOCK button is released.

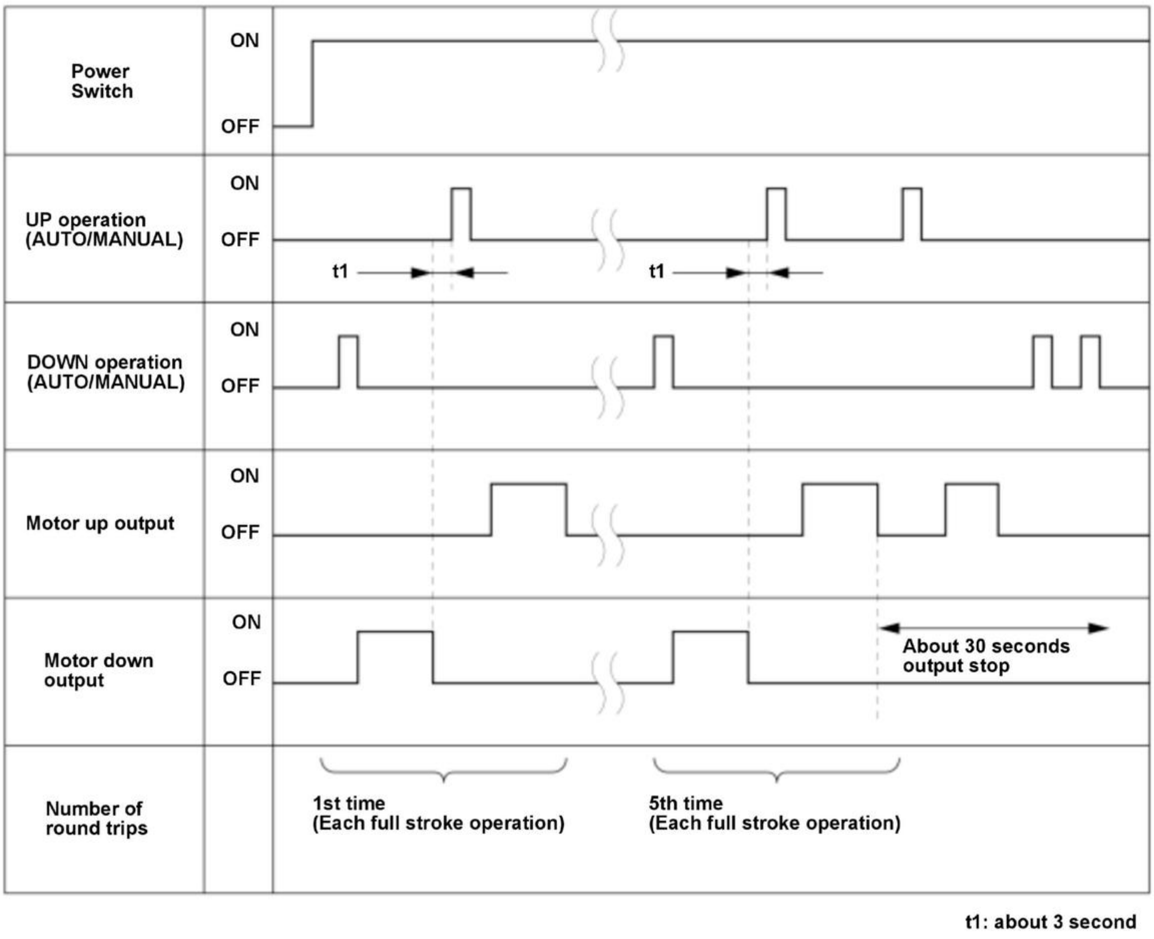
Continuous Operation Stop Function

With the vehicle in the ON mode, when reciprocating movement "upper end -> lower end -> upper end" is repeated 5 times by the AUTO or MANUAL operation of each seat, the DOWN operation is prohibited while about 30 seconds lapse.



Failsafe Function

When a failure occurs in the inputs of the motor pulses and power window switches, the failsafe function stops the control of each function.

POWER WINDOWS SYSTEM DESCRIPTION - COMPONENTS

Power Window Master Switch

The power window master switch has a built-in B-CAN transceiver and a LIN transceiver. The power window master switch sends signals from LIN to front passenger's power window switch, and to the moonroof motor-control unit *.

*: With moonroof

Front Passenger's Power Window Switch

The front passenger's power window switch has a built-in control unit. Control is performed by receiving signals from the power window master switch via LIN.

Power Window Motors

The motor includes the pulse sensors that detect window's position and direction with the motor rotation. The rotating direction (up/down) is detected with the rotating cycles from the 2 pulse sensors and the moving amount (window position) is also detected by considering 4 pulses as one rotation pulse.

LEARNING, RESET & CLEAR

RESETTING THE POWER WINDOW CONTROL UNIT

Procedure

Reset the power window control unit after doing any of the following actions:

- Power window regulator replacement, removal, or installation.
- Glass run channel replacement, removal, or installation.
- Door glass replacement, removal, or installation.
- Power window master switch replacement.
- Front passenger's power window switch replacement*.
- Power is disconnected from the power window master switch or front passenger's power window switch* while the power window timer is ON.

NOTE:

- Steps 3-9 shows the procedure of clearing of the power window control unit, and steps 10-11 shows the procedure of learning. When clearing, use the target power window switch on the power window master switch. When learning, power windows can not be operated from the power window master switch, so use the power window switch of each seat.
- If the front passenger's power window has lost power when the vehicle off timer is ON, it cannot be operated from the driver's switch and must be reset from the front passenger's power window switch*.

*: With front power windows AUTO UP/DOWN function

Without HDS

1. Power Window Control Unit - Reset

   NOTE: Close the door and leave it closed until the procedure is complete.

   1. Turn the vehicle to the ON mode.

   2. Move the power window all the way down with the driver's window DOWN switch.

   NOTE: Steps 3-6 must be done within 5 seconds of each other.

   3. Turn the vehicle to the OFF (LOCK) mode.

   4. Press and hold the power window DOWN switch.

   5. Turn the vehicle to the ON mode.

   6. Release the power window DOWN switch.

   7. Repeat step 3-6 three more times.

   8. Wait at least 1 second.

   9. Confirm that AUTO UP and AUTO DOWN do not work. If AUTO UP and DOWN work, go back to step 1.

   10. Move the power window all the way down with the power window DOWN switch of the seat to be reset.

   11. Pull up and hold the power window UP switch of the seat to be reset until the window reaches the fully closed position, then continue to hold the switch for at least 1 second.

   12. Confirm that the power window control unit is reset by using the driver's window AUTO UP and AUTO DOWN functions:

- If the window still does not work in AUTO, repeat the procedure several times, paying close attention to the 5 seconds time limit between steps.
- If the window still does not work, refer to the power window master switch input test and/or front passenger's power window switch input test*.

*: With front power windows AUTO UP/DOWN function

With HDS

1. Power Window Control Unit - Reset

1. **Connect the HDS to the data link connector**

2. Turn the vehicle to the ON mode.

3. Select the following menu buttons on the HDS screen in sequence.

   - (1) Body Electrical (System Selection Menu)
   - (2) Power Window
   - (3) Adjustment
   - (4) Driver Side Power Window Auto Position Reset

4. Confirm that the power window control unit is reset by using the power window AUTO UP and AUTO DOWN function.

DESCRIPTION AND OPERATION

POWER WINDOWS SYSTEM DESCRIPTION

Basic Control/Function

- Manual Up/Down Function

  The 1-step operation of the power window switch moves the window up or down. This is available during the vehicle in the ON mode or the vehicle OFF operation.

- Auto Up/Down Function

  The 2-step operation of the power window switch moves the window up or down. This is available during the vehicle in the ON mode or the vehicle OFF operation.

Auto Reverse Power Window Function

When an object is detected during the auto up operation, the window stops closing and reverses about 70 mm (2.76 in). If the window is less than halfway opened (about 220 mm (8.66 in)), it will reverse to the half open position (about 220 mm (8.66 in)). In manual operation, this function is active only during the vehicle OFF operation. This function is activated based on the calculation of the rotation speed and load change of the motor's pulse A.

Vehicle OFF Operation

For about 10 minutes after the vehicle is turned to the OFF (LOCK) mode, the window's open/close operation with the power window switches is available.

Keyless/Key Cylinder Operation

By turning the key a second time and holding it with the key inserted into the driver's door key cylinder, the windows and moonroof close (or open) (turning the key clockwise to open, turning the key counterclockwise to close). The windows and moonroof stop moving when the key is returned to the neutral position.

By pressing and holding the UNLOCK button of the remote a second time, the windows and moonroof open. The windows and moonroof stop moving when the UNLOCK button is released. For some models, by pressing and holding the LOCK button of the remote a second time, the windows and moonroof close. The windows and moonroof stop moving when the LOCK button is released.

Failsafe Function

When a failure occurs in the inputs of the motor pulses and power window switches, the failsafe function stops the control of each function.

POWER WINDOWS SYSTEM DESCRIPTION - COMPONENTS

Power Window Master Switch

The power window master switch has a built-in B-CAN transceiver and a LIN transceiver. The power window master switch sends signals from LIN to front passenger's power window switch, panoramic glass roof motor-control unit *1, and to the moonroof motor-control unit *2.

*1: With panoramic glass roof

*2: With moonroof

Front Passenger's Power Window Switch

The front passenger's power window switch has a built-in control unit. Control is performed by receiving signals from the power window master switch via LIN.

Power Window Motors

The motor includes the pulse sensors that detect window's position and direction with the motor rotation. The rotating direction (up/down) is detected with the rotating cycles from the 2 pulse sensors and the moving amount (window position) is also detected by considering 4 pulses as one rotation pulse.

INPUT TEST

FRONT PASSENGER'S POWER WINDOW SWITCH INPUT TEST

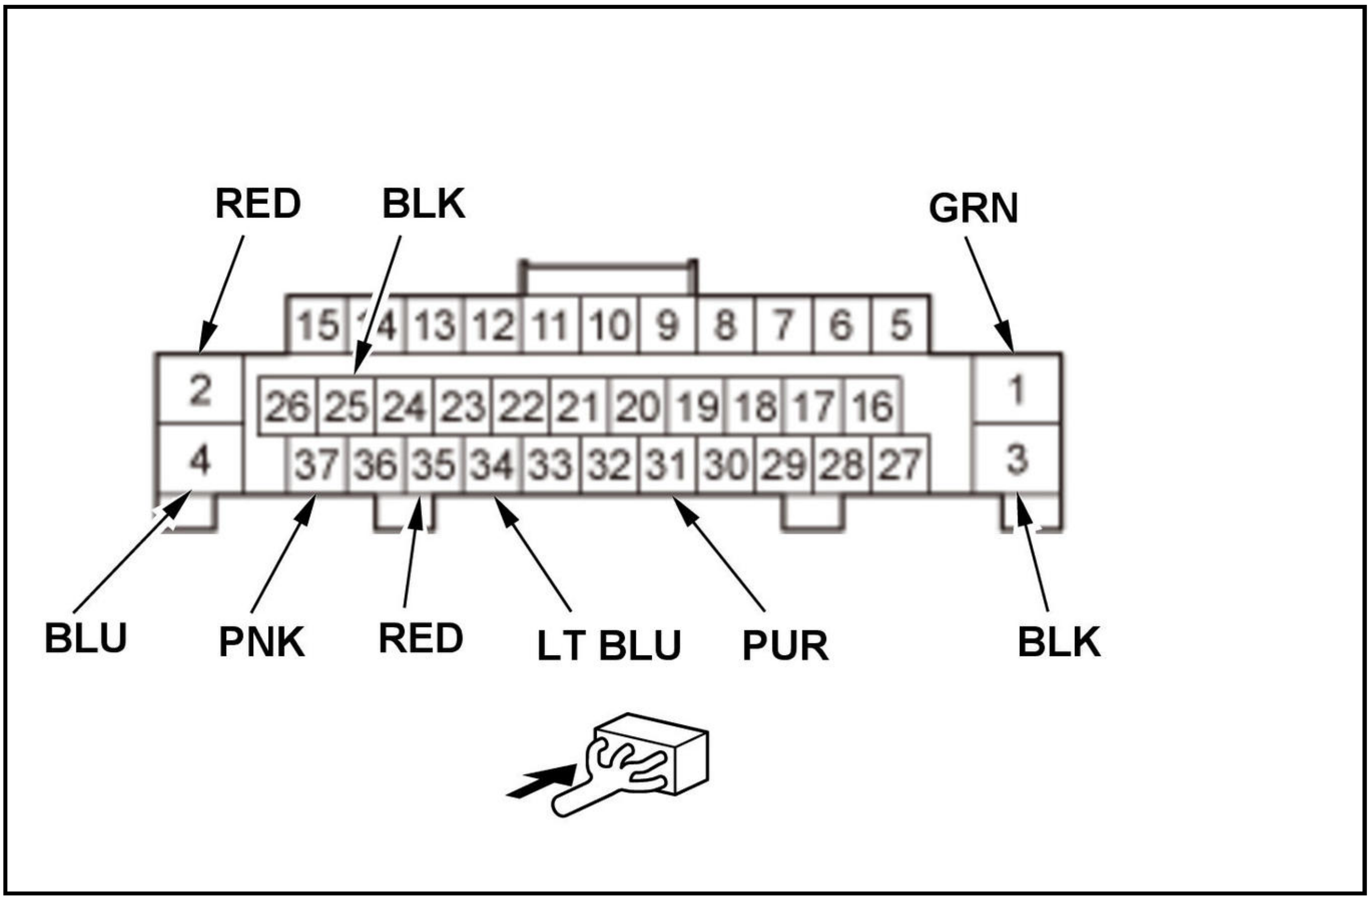
NOTE:

- Make sure the fuses associated with the system is OK.
- If you are troubleshooting multiple DTCs, be sure to follow the instructions in **B-CAN System Diagnosis Test Mode A** .

1. Turn the vehicle to the OFF (LOCK) mode.

2. Disconnect the front passenger's power window switch 37P connector.

Front Passenger's Power Window Switch 37P Connector (female terminals)



3. Inspect the connector and socket terminals to be sure they are all making good contact:

- If the terminals are bent, loose, or corroded, repair them as necessary, and recheck the system.
- If the terminals are OK, go to step 4.

4. With the connector still disconnected, do the following input tests:

- If any test indicates a problem, find and correct the cause, then recheck the system.
- If all the input tests prove OK, go to step 5.

NOTE: Before testing, make sure not to short the power window motor circuit.

1. Remove the harness clips from the door panel as needed.

2. Test the motor in each direction by connecting 12 volt battery power and ground to the power window master switch connector according to the table. When the motor stops running, disconnect battery power immediately. If the motor does not run or fails to run smoothly, **remove the driver's door regulator** , then go to step 3.

LEARNING RESET CLEAR

RESETTING THE POWER WINDOW CONTROL UNIT

Procedure

Reset the power window control unit after doing any of the following actions:

- Power window regulator replacement, removal, or installation.
- Glass run channel replacement, removal, or installation.
- Door glass replacement, removal, or installation.
- Power window master switch replacement.
- Front passenger's power window switch replacement*.
- Power is disconnected from the power window master switch or front passenger's power window switch* while the power window timer is ON.

NOTE: If the front passenger's power window has lost power when the vehicle off timer is ON, it cannot be operated from the driver's switch and must be reset from the front passenger's power window switch*.

*: With front power windows AUTO UP/DOWN function

Without HDS

1. Power Window Control Unit - Reset

    1. Turn the vehicle to the ON mode.

    2. Move the power window all the way down with the driver's window DOWN switch.

    NOTE: Steps must be done within 5 seconds of each other.

    3. Turn the vehicle to the OFF (LOCK) mode.

    4. Press and hold the power window DOWN switch.

    5. Turn the vehicle to the ON mode.

    6. Release the power window DOWN switch.

    7. Repeat step 3-6 three more times.

    8. Wait at least 1 second.

    9. Confirm that AUTO UP and AUTO DOWN do not work. If AUTO UP and DOWN work, go back to step 1.

    10. Move the power window all the way down with the power window DOWN switch.

    11. Pull up and hold the power window UP switch until the window reaches the fully closed position, then continue to hold the switch for at least 1 second.

    12. Confirm that the power window control unit is reset by using the driver's window AUTO UP and AUTO DOWN functions:

        - If the window still does not work in AUTO, repeat the procedure several times, paying close attention to the 5 seconds time limit between steps.
        - If the window still does not work, refer to the master switch input test.

    With HDS

2. Power Window Control Unit - Reset

1. **Connect the HDS to the data link connector**

2. Select BODY ELECTRICAL from the SYSTEM SELECTION MENU.

3. From the BODY ELECTRICAL SYSTEM SELECT menu, select POWER WINDOWS.

4. From the MODE MENU, select ADJUSTMENT.

5. From the ADJUSTMENT MENU, select POWER WINDOW RESET FOR DRIVER SIDE (PASSENGER'S SIDE).

6. Follow the prompts on the screen.

7. Confirm that the power window control unit is reset by using the power window AUTO UP and AUTO DOWN function.

DTC ADVANCED DIAGNOSTICS

DTC C0049-7A (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C0049-7A : Brake Fluid Leak or Seal Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Brake Booster System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Start the engine. • Press the brake pedal several times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle
Fail Safe Action	• Stop automatic brake hold function • Stop ACC function* • Stop CMBS function*
Possible Cause	• Master cylinder internal failure • Brake fluid leakage

*: With ACC

DTC C1250-98 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1250-98 : ECU Internal Malfunction (Over Temperature)

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Degrade servo control performance
Possible Cause	• Electric brake booster overheating • Electric brake booster internal failure

DTC C1250-98 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

DTC C1250-98 : ECU Internal Malfunction (Over Temperature)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.

Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (Dependant upon the conditions) • Brake system indicator (amber) on
Fail Safe Action	• Stop servo control function or degrade servo control performance (Dependant upon the conditions) • Stop automatic brake hold function or degrade automatic brake hold performance (Dependant upon the conditions) • Stop LSF function or degrade LSF performance (Dependant upon the conditions) • Stop ACC function or degrade ACC performance (Dependant upon the conditions) • Stop CMBS function or degrade CMBS performance (Dependant upon the conditions)
Possible Cause	• Electric brake booster overheating • Electric brake booster internal failure

DTC C1C01-96 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1C01-96 : Brake Pedal Stroke Sensor Component Internal Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on

	- Brake system indicator (amber) on
Fail Safe Action	- Stop servo control function - Stop automatic brake hold function - Stop ACC function* - Stop CMBS function*
Possible Cause	- Electric brake booster internal failure (Brake pedal stroke sensor)

*: With ACC

DTC C1C01-96 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

DTC C1C01-96 : Brake Pedal Stroke Sensor Component Internal Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Start the engine. - Test-drive the vehicle without pressing the brake pedal for 1 minute or more. (Be careful of the surrounding traffic conditions.) - Turn the vehicle to the OFF (LOCK) mode, then wait for 3 minutes or more. - Turn the vehicle to the ON mode, then wait for 1 minute or more. (Do not press the brake pedal during 1 minute elapse.)
Execution	Initial Diagnosis/Regular Diagnosis
Duration	-
DTC Type	- 1 drive cycle or 2 drive cycle (Dependant upon the conditions) - Brake system indicator (red) on - Brake system indicator (amber) on
Fail Safe Action	- Stop servo control function - Stop automatic brake hold function

	- Stop LSF function - Stop ACC function - Stop CMBS function
Possible Cause	- Electric brake booster internal failure (Brake pedal stroke sensor)

DTC C1C02-11 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

DTC C1C02-11 : Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (red) on - Brake system indicator (amber) on
Fail Safe Action	- Stop servo control function - Stop automatic brake hold function - Stop LSF function - Stop ACC function - Stop CMBS function
Possible Cause	- Short to ground between the electric brake booster and the brake pedal stroke sensor (PTS1 line) - Electric brake booster internal failure

DTC C1C02-12 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1C02-12 : Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Brake Booster System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on
Fail Safe Action	• Stop servo control function • Stop automatic brake hold function • Stop ACC function* • Stop CMBS function*
Possible Cause	• Short to power between the electric brake booster and the brake pedal stroke sensor (PTS1 line) • Electric brake booster internal failure

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 6.0 - 18.9 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop automatic brake hold function • Stop ACC function *1 • Stop CMBS function *1
Possible Cause	• Open, Short to ground, Short to power, or Short to another line between the electric brake booster and the VSA modulator-control unit (EBB CAN lines) *2 • Open, Short to ground, Short to power, or Short to another line between the electric brake booster and the VSA modulator-control unit (F-CAN B lines) *3 • VSA modulator-control unit internal failure • Electric brake booster internal failure

DTC U3000-49 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC U3000-49 : ECU Internal Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Brake Booster System" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 6.0 - 18.9 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis

NOTE: During installation, apply multipurpose grease to the clevis pin in the brake pedal.

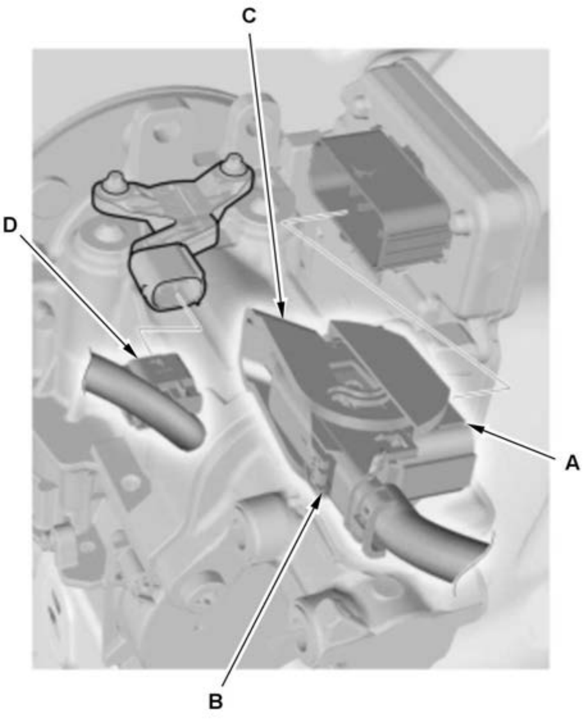
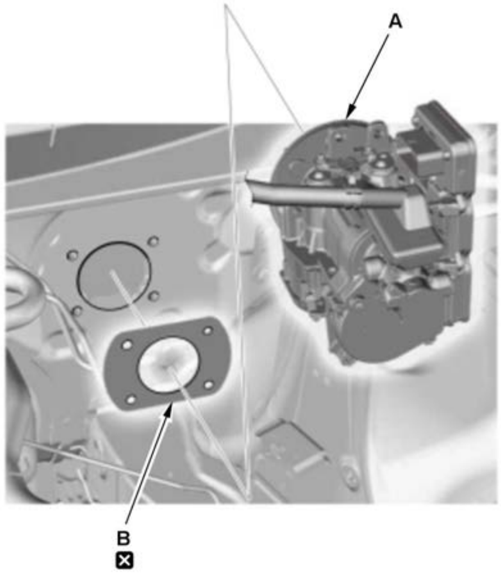
3. Remove the electric brake booster mounting nuts (C).



4. **Disconnect the brake lines from the master cylinder**

5. Disconnect the connector (A) by pushing the lock (B) and pulling up the lever (C); the connector disconnects itself.

6. Disconnect the connector (D).



7. Remove the electric brake booster (A) from the engine compartment.

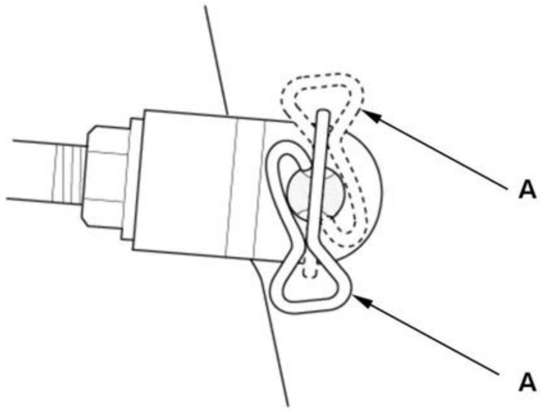
NOTE:

- Be careful not to damage the electric brake booster surfaces and threads of the electric brake booster stud bolts.
- Be careful not to bend or damage the other components hoses and lines.

8. Remove the gasket (B).

NOTE: Use a new electric brake booster gasket during reassembly.

8. All Removed Parts - Install



1. Install all removed parts in the reverse order of removal.

DESCRIPTION & OPERATION

ELECTRIC SERVO BRAKE SYSTEM DESCRIPTION

Overview

The electric servo brake system is used to convert as much of the vehicle's kinetic energy as possible into electricity and store it in the battery. The system enables to maximize the regenerative brake force depending on the brake pedal pressure available. The braking force is determined by the amount of regenerative electricity and the brake. When vehicle speed is low, the brake creates most of the braking force.

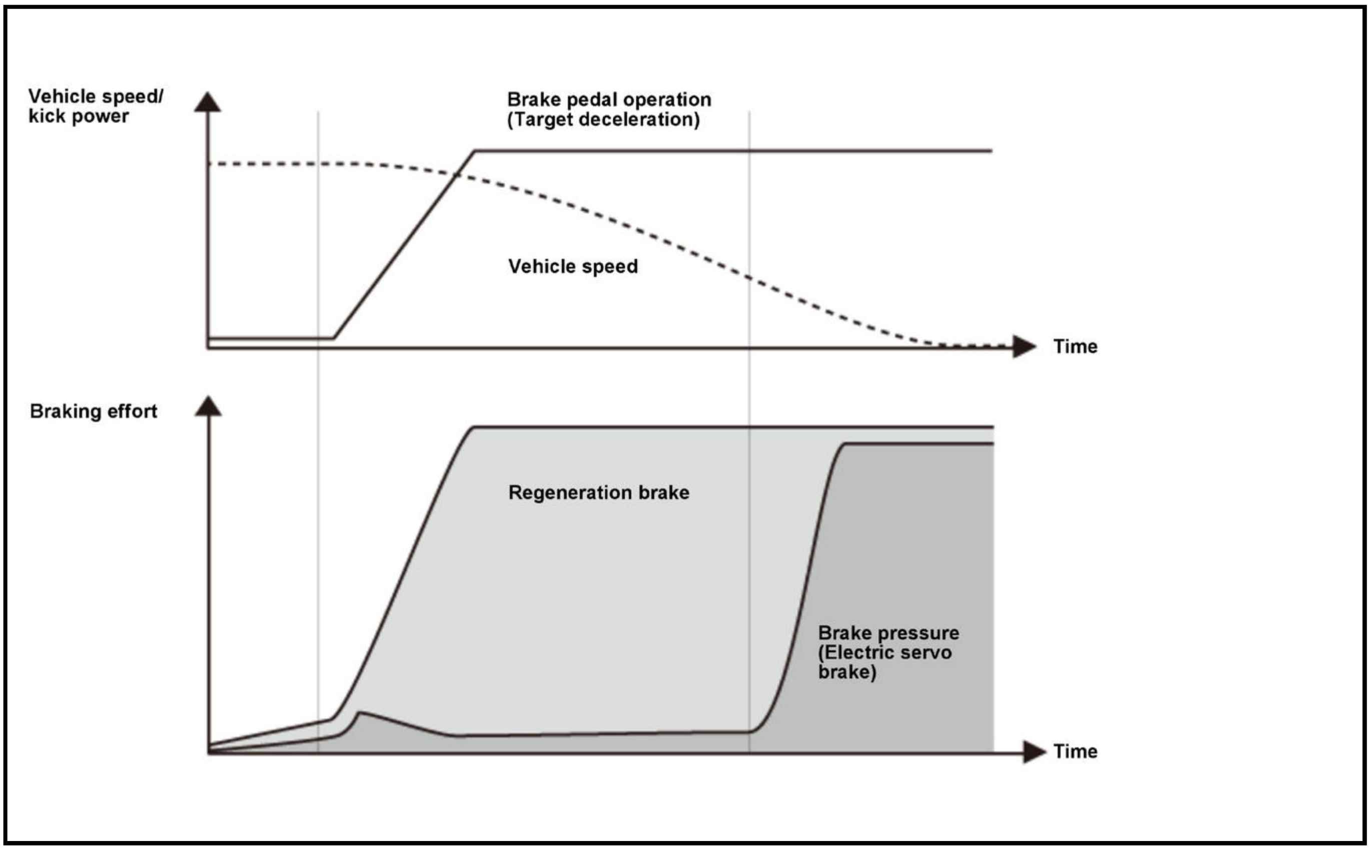
Electric servo brake system performs the following control:

- Servo control: Reduces the driver's effort for operating the brake pedal.
- Regeneration control: Coordinated control with the regenerative brake by the traction motor.
- Stall management: Protective control of the traction motor.
- Brake assist control: Increases the braking force when emergency braking is detected.
- Hill start assist control: Startup assist on a slope road.
- Automatic brake hold: Reduces the driver's load for operating the brake pedal.

On vehicles equipped with ACC and CMBS, the electric servo brake system performs brake control for the ACC and the CMBS.

Brake Control

If vehicle speed is low, the amount of regeneration by the traction motor decreases, thus causing a decline in braking effort. The electric servo brake control unit drives the motor of the tandem motor cylinder to increase fluid pressure while minimizing the change in braking effort, enabling a smooth transition from regeneration brake to hydraulic brake.



Servo Control

System Shutdown State

When the electric servo brake system is shut down, the master cylinder cut valve (MCV) opens and the pedal feel simulator cut valve (PFSV) is closed while the brake pedal is not in use.

Servo Control Operations

During normal operation, the master cylinder cut valve (MCV) closes and the pedal feel simulator cut valve (PFSV) is open. Under these conditions, the system can prevent the brake hydraulic pressure created by the braking pedal force from transmitting to the VSA modulator-control unit. Pedal feedback is created virtually by the pedal feel simulator. The hydraulic pressure for the VSA modulator-control unit is created when the piston in the slave cylinder gets pushed by a thrust force. The thrust force is transmitted from the rotary torque of the motor in the tandem motor cylinder using a gearbox. The required hydraulic pressure is calculated by the electric servo brake control unit using the stroke sensor signal and controlled by the rotary angle of the motor in the tandem motor cylinder.

Regeneration Control Operations

When the brake and regeneration system work together, the master cylinder cut valve (MCV) closes and the pedal feel simulator cut valve (PFSV) is open. The electric servo brake control unit uses the information on the amount of charge in the regenerative electricity system to activate the motor in the tandem motor cylinder and reduce the hydraulic pressure. At the same time, the unit also increases the amount of charge in regenerative electricity system.

Stall Management

When driving uphill, the driving force of the vehicle's drive motor balances against the gravitational force that pulls the vehicle back. Electric current continues to flow only to specific motor drive circuits, generating heat in them. If driving uphill for an extended period of time, the amount of heat generated could damage the circuit and motor. To prevent overheating, the stall cooperative control activates the electric servo brake, which prevents the vehicle drive circuit from overheating. When the brake or the accelerator pedal are pressed, the stall cooperative control stops.

The PCU (power control unit) initiates the electric servo brake control unit before the drivetrain overheats
Stall management
The electric servo brake activates, and the braking keeps the vehicle stopped while the brake lights illuminate
Power from the battery to the electric motor is discontinued to enable cooling of the drivetrain
Operating the brakes or the accelerator pedal to start the vehicle, and stops the stall cooperative control
Driving/forward progress

System Wake-Up and Shutdown

The electric servo brake system is activated when the driver's door is opened while the vehicle is in the OFF (LOCK) mode or when the vehicle is turned to the ON mode.

When the electric servo brake system is not activated (the vehicle is turned to the ON mode while pressing the brake pedal) the brake pedal may travel down as the pedal feel simulator cut valve (PFSV) opens. This is normal and not a system fault. To prevent the driver from feeling this condition at system start-up, the electric servo brake system is activated for 3 minutes, triggered by the driver's door switch signal when the driver's door is opened. To prevent excessive battery discharge, the system will automatically shut down after 3 minutes from when the driver's door is opened.

Activating and shutting down the system by the driver's door operation is as follows.

Open the driver's door

ELECTRIC SERVO BRAKE SYSTEM DESCRIPTION - AUTOMATIC BRAKE HOLD

Overview

With automatic brake hold, the vehicle stays in a stopped state by using the main brakes and will remain stopped even when the brake pedal is released. There is no need to keep pressing the brake pedal while stopped in heavy traffic or at traffic lights.

Control

As the accelerator pedal is pressed, the automatic brake hold feature is cancelled and returns to the stand by mode. If the automatic brake hold features is applied for an extended time (approx.10 minutes), the electric parking brake will engage to hold the vehicle.

ELECTRIC SERVO BRAKE SYSTEM DESCRIPTION - BRAKE ASSIST CONTROL

The brake assist control constantly monitors brake operation through the pressure sensor. If the pedal stroke speed and pedal stroke amount exceed the predetermined values, it is considered to be emergency braking. When emergency braking is determined to be taking place, the electric servo brake control unit increases braking force compared to normal braking and shortens the braking distance.

ELECTRIC SERVO BRAKE SYSTEM DESCRIPTION - COMPONENTS

Components

The electric servo brake system consists of the following primary components:

- Electric servo brake control unit/pedal feel simulator
- Tandem motor cylinder
- Brake pedal stroke sensor
- System indicator

For locations of each component on the vehicle, refer to Component Location Index, and for functions of the indicator, refer to How to Troubleshoot the Electric Servo Brake System.

Electric Servo Brake Control Unit/Pedal Feel Simulator

The electric servo brake control unit/pedal feel simulator consists of the electric servo brake control unit, master cylinder, pedal force simulator, pedal feel simulator valve (PFSV), master cylinder cut valves (MCV), and hydraulic pressure sensors. It reproduces the feel when the brake pedal is pressed.

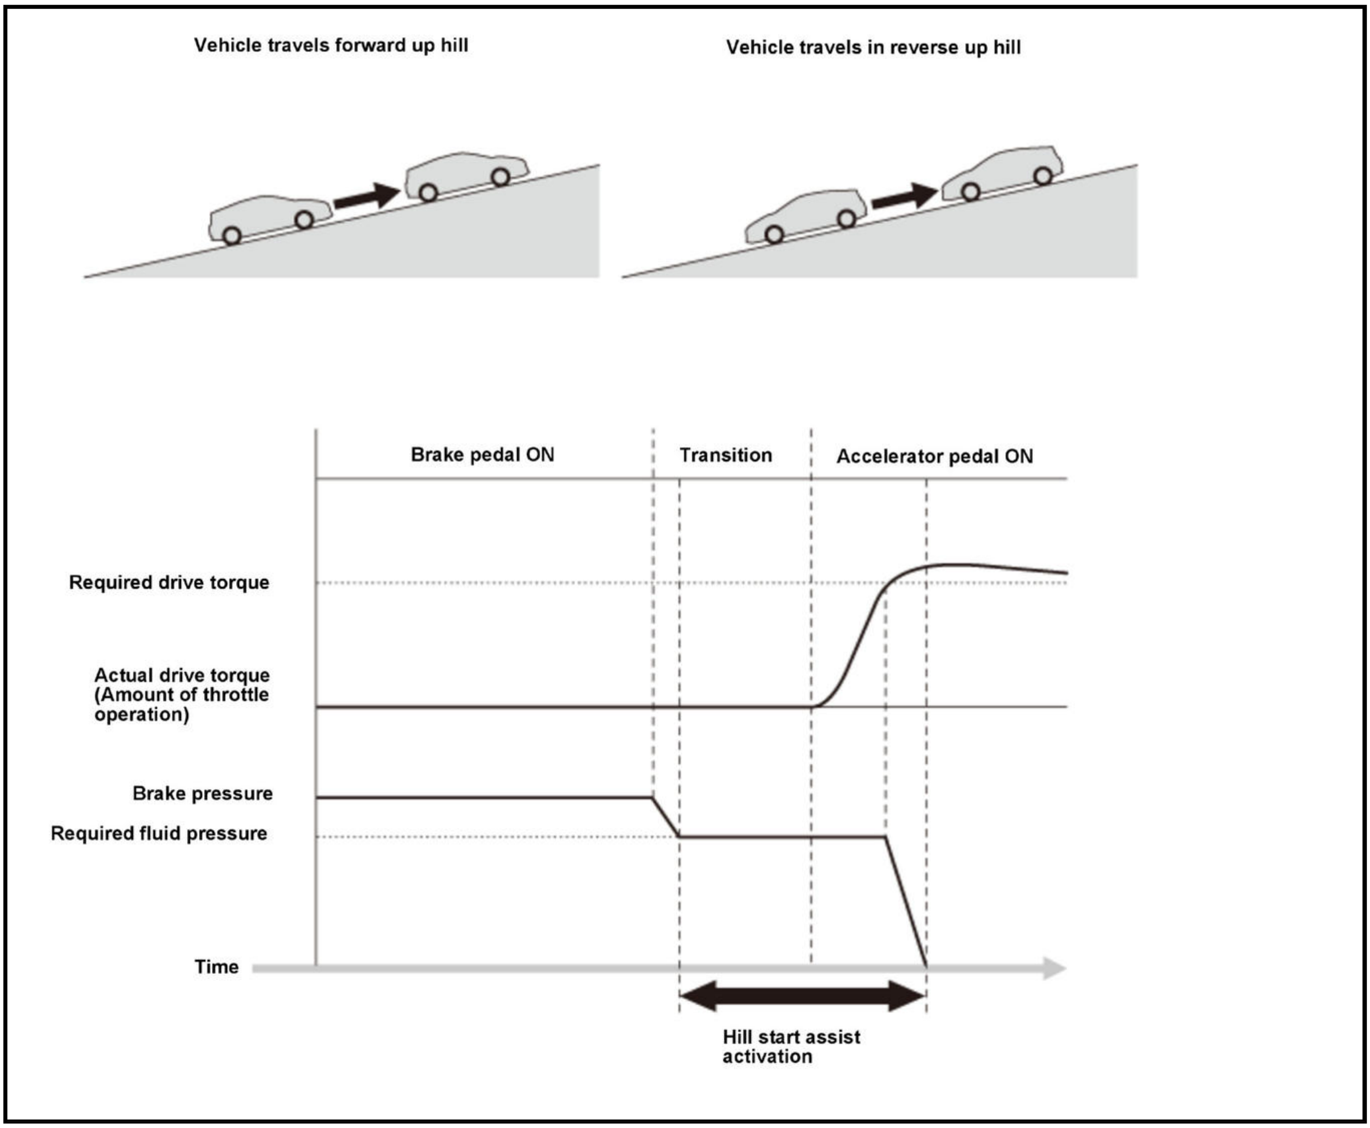
ELECTRIC SERVO BRAKE SYSTEM DESCRIPTION - HILL START ASSIST CONTROL

Overview

The hill start assist control assists drivers by automatically controlling brake pressure when starting a vehicle on a steep hill; this assist prevents the vehicle from rolling on a hill for a few seconds while the driver's foot moves from the brake pedal to the accelerator pedal. The hill start assist control may not be activated when the driver does not press the brake pedal strongly enough upon stopping the vehicle or when the driver releases the brake pedal gradually upon starting the vehicle.

Control

The control unit reads the angle of inclination from the longitudinal acceleration signal and that all four wheels are stopped, then it calculates the amount of fluid pressure required to keep the vehicle from rolling backward. This takes place as the control unit sees the brake pressure decrease when the driver lifts their foot off of the brake pedal and moves it onto the accelerator pedal. After the driver transitions to the accelerator pedal and the drive torque is restored to the predetermined level required to start-up the vehicle, the hill start assist control will release the brake fluid pressure. The hill start assist control will release the brake fluid pressure if the accelerator pedal is not pressed for a certain period of time after the brake pedal has been released.



ELECTRIC SERVO BRAKE SYSTEM DESCRIPTION - SYSTEM DIAGRAM

The electric servo brake control unit receives the pedal stroke signal from the brake pedal stroke sensor, regeneration control information from the electric powertrain system, and various other signals. Based on these signals, the electric servo brake unit drives the valve in the pedal feel simulator and the motor of the tandem motor cylinder, while controlling the brake fluid pressure, and therefore the braking force for each wheel. If a problem is detected, the warning indicator in the gauge control module illuminates to inform the driver about the problem.

4. Brake Pad - Remove

	1. Remove the brake hose mounting bolt (A). 2. Remove the flange bolt (B) while holding the caliper pin (C) with a wrench. **NOTE:** Be careful not to damage the pin boot. 3. Pivot the caliper body (D) up out of the way. - Be careful when pivoting the caliper body up or the spring could pop out of position. - Check the hose and the pin boots for damage and deterioration.

	4. Remove the pad return springs (A). 5. Remove the pad shims (B) and the brake pads (C). 6. Remove the pad retainers (D). **NOTE:** The upper and lower pad retainers are different. During installation, make sure the pad retainers are in the proper positions. 7. Clean the caliper bracket (E) thoroughly; remove any rust, and check for grooves and cracks. 8. Verify that the caliper pins (F) move in and out smoothly. Clean and lube if needed.

5. Brake Disc - Inspect

Installation

NOTE:

- **How to read the torque specifications** .
- **Review the Service Precautions before doing repairs or service**.

1. Brake Pad - Install

 	1. Install the brake caliper piston compressor tool (A) on the caliper body (B). 2. Press in the piston with the brake caliper piston compressor tool. 3. Remove the brake caliper piston compressor tool.

 	4. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to the retainer mating surface of the caliper bracket (indicated by the arrows). 5. Install the pad retainers (A). **NOTE:** - **The upper and lower pad retainers are different. During installation, make sure the pad retainers are in the proper positions.** - **If you are replacing the brake pads with new ones, also replace the pad retainers.** 6. Wipe off the excess assembly paste from the retainers. Keep the assembly paste away from the brake disc and the brake pads.

	7. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to the pad side of the shims (B), the back of the brake pads (C), and the other areas indicated by the arrows. 8. Wipe off the excess assembly paste from the pad shims and brake pads friction material. Keep grease and assembly paste away from the brake disc and brake pads. Contaminated brake disc or brake pads reduce stopping ability. 9. Install the brake pads and pad shims correctly, with the wear indicator (D) on the upper inside position. **NOTE:** If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a temporary loss of braking efficiency. 10. Install the pad return springs (E).

1. Inspect the brake disc to wheel surface for damage and cracks.

2. Clean the brake disc thoroughly, and remove all rust.

3. Install suitable flat washers (A) and the wheel nuts (B).

4. Tighten the wheel nuts to the specified torque to hold the brake disc securely against the hub.

5. Set up the dial gauge (C) against the brake disc as shown.

6. Measure the runout at 10 mm (0.39 in) from the outer edge of the brake disc.

7. If the brake disc is beyond the service limit, refinish the brake disc with a Honda-approved commercially available

on-car brake lathe.

NOTE:

- If the brake disc is beyond the service limit for refinishing, replace it.
- If the brake disc is replaced with a new one, check the new disc for runout. If the new disc is out of specification, refinish the disc.
- For more information on Honda-approved brake lathes, refer to any authorized service information related brake disc refinishing (if available).

REAR BRAKE PAD REMOVAL, INSTALLATION, AND INSPECTION

Special Tools Required

Image	Description/Tool Number
	Brake Caliper Piston Compressor 07AAE-SEPA101

Removal

NOTE: **Review the Service Precautions before doing repairs or service**.

1. Brake Fluid - Remove

1. Remove some brake fluid from the reservoir.

2. **Vehicle - Lift**
3. **Rear Wheels - Remove**
4. Brake Caliper Piston - Enter the MAINTENANCE MODE

NOTE: If the HDS was not used, **remove the electric parking brake actuator, and using a TORX driver, turn the spindle clockwise until it comes to a lock** .

1. **Connect the HDS to the data link connector (DLC)**

2. Select ADJUSTMENT from ABS/VSA menu with the HDS, then enter ENTER BRAKE PAD MAINTENANCE MODE from BRAKE PAD MAINTENANCE MODE, and follow the screen prompts. Make sure TRANSITION TO PAD EXCHANGE MODE HAS BEEN COMPLETED on the screen.

3. Turn the vehicle to the OFF (LOCK) mode.

5. Brake Pad - Remove

	1. Remove the brake hose mounting bolt (A).

	2. Disconnect the connector (A). **NOTE:** If the connector lock tab is difficult to release, push in on the connector body before pushing on the release lock. 3. Remove the caliper body (B). **NOTE:** Check the hose and the pin boots for damage and deterioration.

	4. Remove the pad shims (A) and the brake pads (B). **NOTE:** Be careful not to damage or deform the pad return springs (C). 5. Remove the pad retainers (D). **NOTE:** The upper and lower pad retainers are different. During installation, make sure the pad retainers are in the proper positions. 6. Clean the caliper bracket (E) thoroughly; remove any rust, and check for grooves and cracks. 7. Verify that the caliper pins (F) move in and out smoothly. Clean and lube if needed.

6. Brake Disc - Inspect

Installation

NOTE:

- How to read the torque specifications .
- Review the Service Precautions before doing repairs or service.

1. Brake Caliper Piston - Return

	1. Install the brake caliper piston compressor tool (A) on the caliper body (B). 2. Press in the piston with the brake caliper piston compressor tool. 3. Remove the brake caliper piston compressor tool.

2. Brake Pad - Install

	1. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to the retainer mating surface of the caliper bracket (indicated by the arrows). **NOTE:** Do not apply the assembly paste to area of unless otherwise specified. 2. Install the pad retainers (A). - The upper and lower pad retainers are different. During installation, make sure the pad retainers are in the proper positions. - If you are replacing the brake pads with new ones, also replace the pad retainers. - If the brake pads do not need to be replaced with new ones, check the retainer. If the retainer is not normal, replace it with a new one. 3. Wipe off the excess assembly paste from the retainers. Keep the assembly paste away from the brake disc and the brake pads. 4. Install the brake pads (B) and pad shims (C) correctly with the indicator (D) on the bottom inside position. **NOTE:** - **If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a temporary loss of braking efficiency.** - **Be careful not to damage or deform the pad return springs (E). If the pad return springs is damaged or deformed,**

	replace the brake pad as an assembly. • **The upper and lower pad return springs are different. During installation, make sure the pad return springs are in the proper positions.**

7. Install the brake hose mounting bolt (A).

3. Brake Caliper Piston - Finish the MAINTENANCE MODE

NOTE: If the HDS was not used, **install the electric parking brake actuator** .

1. Turn the vehicle to the ON mode.

2. Select ADJUSTMENT from ABS/VSA menu with the HDS, then enter BACK TO NORMAL MODE from BRAKE PAD MAINTENANCE MODE, and follow the screen prompts. Make sure THIS FUNCTION PROCEDURE IS FINISHED on the screen, then press the enter button.

3. Turn the vehicle to the OFF (LOCK) mode.

4. **Rear Wheels - Install**

5. Brake Fluid - Refill

1. Add brake fluid as needed.

Inspection

NOTE: **Review the Service Precautions before doing repairs or service**.

1. **Vehicle - Lift**
2. **Rear Wheels - Remove**
3. Rear Brake Pad - Inspect

	1. Check the thickness (A) of the inner pad (B) and the outer pad (C). Do not include the thickness of the backing plate. 2. If any part of the brake pad thickness is less than the service limit, replace the brake pads as a set.

Brake pad thickness:

GENERAL INFORMATION

CONVENTIONAL BRAKE SERVICE PRECAUTIONS

Check the following precautions when handling the brake fluid and brake parts.

Handling the Brake Fluid

NOTICE:

Do not spill brake fluid on the vehicle; it may damage the paint. If brake fluid does contact the paint, wash it off immediately with water.

- Brake fluid is poisonous. If ingested, get medical attention immediately.
- Use recommend new genuine Acura or Honda Brake Fluid from an unopened container. Using a non-Acura or non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Do not reuse drained brake fluid.
- Make sure no dirt or other foreign matter gets into the brake fluid.

Handling the Brake Parts

WARNING:

Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.

- Avoid breathing dust particles.
- Never use a compressed air gun (unless specified) to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

- Clean all parts with brake cleaner and air dry.
- Before reassembling, check that all the parts are free of dirt and other foreign particles.
- Replace parts with new ones whenever specified to do so.
- Make sure no grease or oil gets on the brake discs, the brake drums, the brake pads, or the brake shoes.
- Before installing the brake disc or the brake drum, clean the mating surfaces between the hub or hub bearing unit and the inside of the brake disc or the brake drum.
- After removing the brake hoses and the brake lines, plug the ends of the hoses and the joints to prevent spilling brake fluid.
- Be careful not to bend, damage, or deform the brake lines.
- After installing the brake hoses, check the brake hoses for interference and twisting.
- During brake caliper removal, to prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage.
- Be careful when pressing or moving the piston back in the caliper; brake fluid might overflow from the master cylinder's reservoir. If brake fluid gets on any painted surface, wash it off immediately with water.

BRAKE HOSE AND LINE INSPECTION

Inspection

1. Brake Hose and Line - Inspect
   1. Inspect the brake hoses for damage, deterioration, leaks, interference, and twisting.
   2. Check the brake lines for damage, rusting, and leaks. Also check for bent brake lines.
   3. Check for leaks at hose and line joints and connections, and retighten if necessary.
   4. Check the tandem motor cylinder and the pedal feel simulator for damage and leaks.
   5. Check the VSA modulator-control unit for damage and leaks.

REPLACEMENT

BRAKE FLUID REPLACEMENT

Replacement

NOTICE:

- Review the Service Precautions before doing repairs or service.
- There are three different methods used for bleeding brake systems. The method shown in this procedure is the preferred method for removing the air from the system. For pressure or vacuum bleeding, refer to the tool manufacturer's instructions included with the tool. If you use a commercially available pressure feed bleeder and operate the brake pedal, excessive hydraulic pressure will be applied to the cup inside the master cylinder causing damage. Do not use these methods together.

NOTE:

- The reservoir connected to the pedal feel simulator must be at the MAX (upper) level mark at the start of the bleeding procedure and checked after bleeding each wheel. Add fluid as required.
- Because brake fluid is replaced with the vehicle in the ON mode, the brake system indicator is indicated by brake fluid decrease. The brake system indicator goes off by depressing the brake pedal for about 3 seconds.
- Press the brake pedal slowly while the vehicle is being in ON mode.
- Before beginning the bleeding procedure, remove the reservoir cap and strainer, and remove any dirt and debris then reinstall the strainer only.
- Bleed the brake system in the following order: front-driver's, front-passenger's, rear-passenger's, and rear-driver's.

1. Vehicle - Lift
2. Turn the Vehicle to the ON Mode
3. Brake System - Bleed 1 (Between Tandem Motor Cylinder and Each Brake)

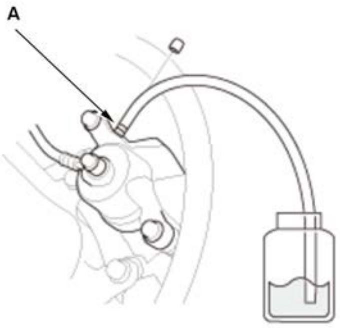
	1. Attach a clear tube (A) to the bleed screw (B). 2. Submerge the other end of the clear tube into a clear plastic catch bottle of brake fluid (C). 3. Have an assistant slowly pump the brake pedal several times then apply steady continuous pressure. 4. Loosen the bleed screw slowly to bleed the fluid into the plastic catch bottle. The brake pedal will travel toward the floor as the fluid is bled from the system. 5. When the brake pedal reaches the floor, have the assistant hold the pedal in that position, then tighten the bleed screw. The brake pedal can now be released. 6. Check and refill the reservoir tank to the MAX (upper) level line. Be sure to reinstall the reservoir cap. 7. Repeat steps 3 thru 6 until the brake fluid in the clear drain tube appears to be clean and new. Then tighten the bleed screw to the specified torque 8. Repeat this procedure for each brake in the bleeding sequence.

4. Turn the Vehicle to the OFF (LOCK) Mode

1. Turn the vehicle to the OFF (LOCK) mode, and wait 3 minutes or more.

NOTE: After 3 minutes, do not open or close the door.

5. Brake System - Bleed 2 (Between Pedal Feel Simulator and Each Brake)



1. Have an assistant slowly pump the brake pedal several times then apply steady continuous pressure.

2. Loosen the bleed screw (A) slowly to bleed the fluid into the plastic catch bottle. The brake pedal will travel toward the floor as the fluid is bled from the system.

3. When the brake pedal reaches the floor, have the assistant hold the pedal in that position, then tighten the bleed screw. The brake pedal can now be released.

4. Check and refill the reservoir tank to the MAX (upper) level line. Be sure to reinstall the reservoir cap.

5. Repeat steps 1 thru 4 until the brake fluid in the clear tube appears to be clean and new. **Then tighten the bleed screw to the specified torque**

6. Repeat this procedure for each bleed screw of the brake caliper in the bleeding sequence.

6. After Bleeding - Check

1. Make sure the brake fluid level in reservoir is at the MAX (upper) level line.

2. Turn the vehicle to the ON mode.

3. Depress the pedal with a normal force, and keep the pedal depressed for about 3 seconds.

4. Release the brake pedal.

5. Check that the brake system indicator does not come on.

SYMPTOM TROUBLESHOOTING

BRAKE SYSTEM SYMPTOM TROUBLESHOOTING - RAPID BRAKE PAD WEAR, VEHICLE VIBRATION (AFTER A LONG DRIVE), OR HIGH, HARD BRAKE PEDAL

NOTE: Make sure that the caliper pins are installed correctly. The upper caliper pin and the lower caliper pin are different. If these caliper pins are installed in the wrong location, it will cause vibration, uneven or rapid brake pad wear, and possibly uneven tire wear. See the proper caliper pin location:

- **Front caliper**
- **Rear caliper**

1. Electric servo brake system check

-1. Turn the vehicle to the ON mode.

-2. Check the brake system indicator (red) and the brake system indicator (amber) for several seconds when the vehicle to the ON mode.

Do the indicators come on then go off?

YES

Go to step 2.

NO

Go to electric servo brake system troubleshooting.

2. Electric parking brake system check

   -1. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -2. Check the brake system indicator (red) and the brake system indicator (amber) for several seconds when the vehicle to the ON mode.

   Does the indicator come on then go off?

   YES

   Go to step 3.

   NO

   Go to electric parking brake system troubleshooting .

3. Brake system check

   -1. Drive the vehicle to note if the brakes drag or the pedal becomes high and hard. This may take 20 or more brake pedal applications during an extended test-drive.

   -2. With the vehicle in the READY TO DRIVE mode, **raise and support the vehicle** , and spin all four wheels by hand.

   Is there brake drag at any of the wheels?

   YES

   Go to step 4.

   NO

   Look for other causes of pad wear, high pedal, or vehicle vibration.

4. Brake pedal position switch check

   -1. Without removing the brake lines, separate the brake pedal from the pedal feel simulator, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES

   Go to step 5.

   NO

Check the brake pedal position switch adjustment and pedal free play .

5. Caliper check

   -1. Loosen the bleed screws at each caliper, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES

   Check the pedal feel simulator reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid, then replace all rubber parts in the brake system that were exposed to contaminated fluid. If the brake fluid is OK, disassemble and repair the caliper on the wheel(s) with brake drag.

   NO

   Look for and replace any damaged brake lines. If all brake lines are OK, **replace the VSA modulator-control unit** .

SERVICE PROCEDURE

BRAKE SYSTEM INSPECTION AND TEST

Inspection

1. Brake System - Inspect

   Inspect the brake system components listed. Repair or replace any parts that are leaking or damaged.

   Component Inspections:

Component	Procedure	Also check for
Brake hoses	Look for damage or signs of fluid leakage at: • Line joints and banjo bolt connections. • Hoses and lines, also inspect for twisting or damage.	Bulging, twisted, or bent lines.
Caliper	Look for damage or signs of fluid leakage at: • Piston seals. • Banjo bolt connections. • Bleed screw.	Seized or sticking caliper pins.
Tandem Motor Cylinder	Look for damage or signs of fluid leakage at: • Reservoir, reservoir union, or tandem motor cylinder. • Lines, reservoir hose, grommets, and their joints. • Between slave cylinder and gearbox. • Bleed screw.	Bulging seal at reservoir cap. This is a sign of fluid contamination.
Pedal Feel Simulator	Look for damage or signs of fluid leakage at:	Bulging seal at reservoir cap. This is a sign of fluid contamination.

Component	Procedure	Also check for
	• Reservoir, reservoir union, or pedal feel simulator. • Lines, reservoir hose, grommets, and their joints. • Bleed screw.	
VSA modulator-control unit	Look for damage or signs of fluid leakage at: • Line joints. • Modulator-control unit.	B

ELECTRIC SERVO BRAKE SYSTEM BLEEDING

Procedure

NOTICE:

- **Review the Service Precautions before doing repairs or service**.
- There are three different methods used for bleeding brake systems. The method shown in this procedure is the preferred method for removing the air from the system. For pressure or vacuum bleeding, refer to the tool manufacturer's instructions included with the tool. If you use a commercially available pressure feed bleeder and operate the brake pedal, excessive hydraulic pressure will be applied to the cup inside the master cylinder causing damage. Do not use these methods together.

NOTE:

- The procedure of bleeding brake system is different from that of replacing brake fluid. **Refer to the procedure of Brake Fluid Replacement as needed**.
- The reservoir connected to the pedal feel simulator must be at the MAX (upper) level mark at the start of the bleeding procedure and checked after bleeding each wheel. Add fluid as required.
- When a rear brake caliper equipped with an electric parking brake is removed and installed, or overhauled (brake hose was disconnected), the bleeding procedure differs from the normal method. First, bleed the brakes using the normal procedure. Second, follow the procedure listed under rear caliper bleed. Third, bleed the brakes again using the normal procedure. This does not apply when the rear calipers are replaced.
- Before beginning the bleeding procedure, remove the reservoir cap and strainer, and remove any dirt and debris then reinstall the strainer only.
- Bleed the brake system in the following order: front-driver's, front-passenger's, rear-passenger's, and rear-driver's.
- Unless indicated, the illustrations shown are examples only and may not match your vehicle.

1. **Vehicle - Lift**
2. 12 Volt Battery Terminal - Disconnect

    1. Open the driver's door, and wait 3 minutes or more.

    NOTE: Do not turn the vehicle to the ON mode.

    2. **Do the 12 volt battery terminal disconnection procedure**

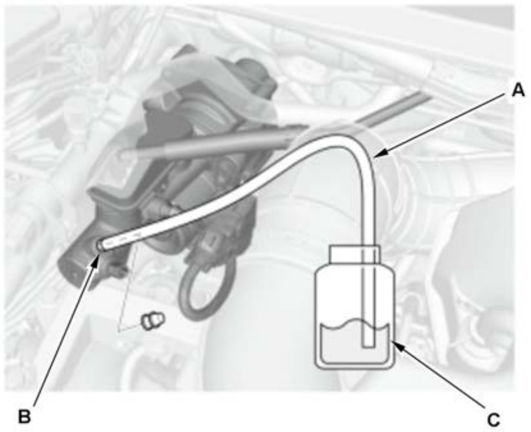
    .

3. Brake System - Normal Bleed 1 (Between Pedal Feel Simulator and Brake Caliper)

 	**NOTE:** If a large amount of air is introduced into the system from a brake system component replacement, first drain the brake fluid into a container from each caliper by pumping the brake pedal slowly before starting the normal brake system bleed. 1. Attach a clear tube (A) to the bleed screw (B). 2. Submerge the other end of the clear tube into a clear plastic catch bottle of brake fluid (C). 3. Have an assistant slowly pump the brake pedal several times then apply steady continuous pressure. 4. Loosen the bleed screw slowly to bleed the fluid into the plastic catch bottle. The brake pedal will travel toward the floor as the fluid is bled from the system. 5. When the brake pedal reaches the floor, have the assistant hold the pedal in that position, then tighten the bleed screw. The brake pedal can now be released. 6. Check and refill the reservoir tank to the MAX (upper) level line. Be sure to reinstall the reservoir cap. 7. Repeat steps 3 thru 6 until the brake fluid in the clear drain tube appears fresh and there are no air bubbles in the fluid. **Then tighten the bleed screw to the specified torque**. 8. Repeat this procedure for each brake in the bleeding sequence.

4. Brake System - Normal Bleed 2 (Between Pedal Feel Simulator and Tandem Motor Cylinder)

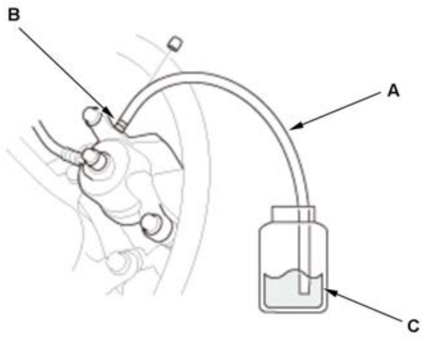
Rear bleed screw  **Front bleed screw**	1. Attach a clear tube (A) to the bleed screw (B). 2. Submerge the other end of the clear tube into a clear plastic catch bottle of brake fluid (C). 3. Have an assistant slowly pump the brake pedal several times then apply steady continuous pressure. 4. Loosen the bleed screw slowly to bleed the fluid into the plastic catch bottle. The brake pedal will travel toward the floor as the fluid is bled from the system. 5. When the brake pedal reaches the floor, have the assistant hold the pedal in that position, then tighten the bleed screw. The brake pedal can now be released. 6. Check and refill the reservoir tank to the MAX (upper) level line. Be sure to reinstall the reservoir cap. 7. Repeat steps 3 thru 6 until the brake fluid in the clear drain tube appears fresh and there are no air



bubbles in the fluid. **Then tighten the bleed screw to the specified torque**

8. Repeat this procedure for each bleed screw of the tandem motor cylinder in the bleeding sequence.

5. Brake System - Normal Bleed 3 (Between Pedal Feel Simulator and Brake Caliper)



1. Attach a clear tube (A) to the bleed screw (B).

2. Submerge the other end of the clear tube into a clear plastic catch bottle of brake fluid (C).

3. Have an assistant slowly pump the brake pedal several times then apply steady continuous pressure.

4. Loosen the bleed screw slowly to bleed the fluid into the plastic catch bottle. The brake pedal will travel toward the floor as the fluid is bled from the system.

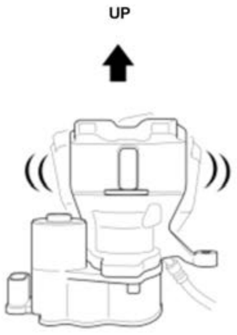
5. When the brake pedal reaches the floor, have the assistant hold the pedal in that position, then tighten the bleed screw. The brake pedal can now be released.

6. Check and refill the reservoir tank to the MAX (upper) level line. Be sure to reinstall the reservoir cap.

7. Repeat steps 3 thru 6 until the brake fluid in the clear drain tube appears fresh and there are no air bubbles in the fluid. **Then tighten the bleed screw to the specified torque**

8. Repeat this procedure for each bleed screw of the brake caliper in the bleeding sequence.

6. Brake System - Rear Caliper Bleed



NOTE:

- When shaking the caliper body, be careful not to damage the electric parking brake actuator.
- When bleeding the brake system, air can get trapped inside the rear calipers. This is due to the complex fluid path inside the electric parking brake calipers. Therefore this procedure is necessary.

1. **Remove the caliper assembly without disconnecting the brake hose from the caliper body** .

	2. Tilt up the caliper body as shown and shake it.

	3. Tilt down the caliper body as shown and shake it again. 4. **Install the rear brake caliper body** 5. Bleed the rear brake again using the normal bleeding procedure.

7. **12 Volt Battery Terminal - Reconnect**
8. After Bleeding - Check

1. Turn the vehicle to the ON mode. 2. Check that the brake system indicator does not come on.

ELECTRIC SERVO BRAKE SYSTEM SENSOR 0 (ZERO) POSITION MEMORIZATION

Procedure

The electric servo brake system sensor 0 (zero) position must be memorized whenever you do any of these actions:

- Electric servo brake control unit/pedal feel simulator removal and installation
- Brake pedal removal and installation
- Electric servo brake control unit update
- Brake pedal height adjustment

1. **HDS - Connect**
2. Sensor 0 (Zero) Position - Memorize

NOTE: If brake system indicator (amber) is blinking before this procedure, press the brake pedal hard while brake system indicator goes off. 1. In the BRAKE SYSTEM MENU of the HDS, select ELECTRIC SERVO BRAKE SYSTEM, select ADJUSTMENT MENU, then select SENSOR 0 (ZERO) POSITION MEMORIZATION.

HOW TO INFORMATION

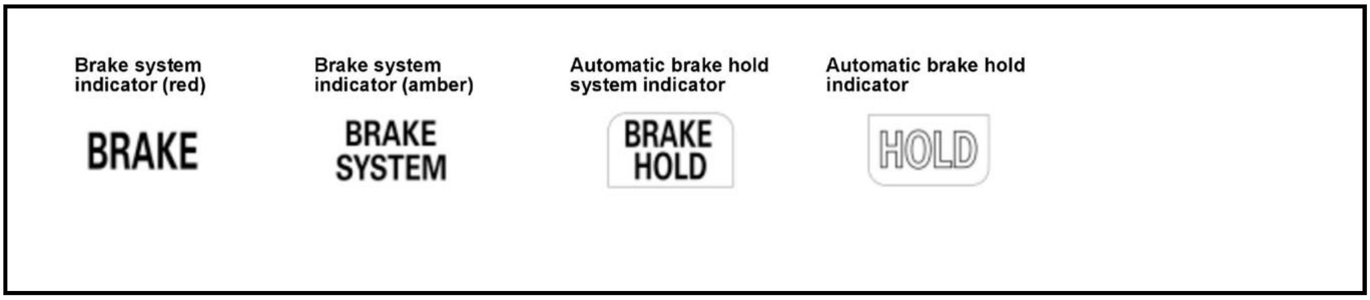
HOW TO TROUBLESHOOT THE ELECTRIC SERVO BRAKE SYSTEM

System Indicator

This system has four indicators:

- Brake system indicator (red)

- Brake system indicator (amber)
- Automatic brake hold system indicator
- Automatic brake hold indicator



Brake system indicator (red)
BRAKE
Brake system indicator (amber)
BRAKE SYSTEM
Automatic brake hold system indicator
BRAKE HOLD
Automatic brake hold indicator
HOLD

NOTE: For locations of each indicator, refer to gauge control module component location index .

When the system is OK, each indicator comes on for about 2 seconds after turning the vehicle to the ON mode, then goes off.

NOTE: If the parking brake is applied, and/or the brake fluid level is low, the brake system indicator (red) will stay on.

When the system detects a problem, it turns on the brake system indicator (amber), and/or the brake system indicator (red). Depending on the failure, the electric servo brake control unit determines which indicators are turned on.

When the brake system indicator (amber) and the brake system indicator (red) comes on, the brakes get heavier and the pedal strokes get longer. Depressing the brake pedal further will cause kickbacks similar to what is felt during ABS activation, which are actually caused by the assist control from the hydraulic brake booster built inside the ABS/VSA modular.

Brake System Indicator (Red)

The brake system indicator (red) comes on when the electric servo brake is lost, or the EBD function is lost, the parking brake is applied, and/or the brake fluid level is low.

NOTE: If two or more wheel speed sensors fail, the brake system indicator (red) will come on along with the VSA indicator.

Brake System Indicator (Amber)

The brake system indicator (amber) comes on, when the regenerative brake control is lost, or the hydraulic boost failure compensation function is lost.

Automatic Brake Hold System Indicator

The automatic brake hold system indicator comes on when the automatic brake hold system is turned ON by using the automatic brake hold switch.

Automatic Brake Hold Indicator

The automatic brake hold indicator comes on when the automatic brake hold function is activating.

Diagnostic Trouble Code (DTC)

- The memory can hold 29 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one.
- The DTCs are indicated in ascending order, not in the order they occurred.
- The DTCs are memorized in an EEPROM in the electric servo brake control unit. Therefore, the memorized DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to

clear the DTCs.

Self-Diagnosis

- Self-diagnosis can be classified into two categories:
-
    - -

      Initial diagnosis: Done right after the vehicle to the ON mode and until the brake system indicator (red), and brake system indicator (amber) go off.
-
    - -

      Regular diagnosis: Done right after the initial diagnosis until turning the vehicle to the OFF (LOCK) mode.
- The electric servo brake control unit does the following functions when a problem is detected by self-diagnosis:
-
    - -

      Switches to the non servo mode.
    - -

      Turns on the brake system indicator (amber) and brake system indicator (red) depending on the failure.
    - -

      Stores the DTC.
    - -

      Stops the regenerative control cooperation.

Servo Motor

- The servo motor operates when the electric servo brake control unit is functioning.
- Turning the vehicle to the ON mode enables the servo motor to operate, and with the vehicle in the OFF (LOCK) mode, the servo motor operates for 3 minutes after opening the driver's door.

Hydraulic Boost Failure Compensation

This vehicle is equipped with a hydraulic boost failure compensation. This hydraulic boost failure compensation uses the VSA modulator-control unit's pressurization control to provide additional brake assist. This is necessary when the electric servo brake system is lost. The hydraulic boost failure compensation can be heard when operating and some kickback will be felt on the brake pedal. This is considered normal characteristics of this system.

Brake Fluid Replacement

Brake fluid replacement procedures are identical to the procedures of the electric servo brake.

Brake Fluid Air Bleeding

Brake fluid air bleeding procedures are identical to the procedures of the electric servo brake.

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the brake system indicator (amber), and/or brake system indicator (red) are still on. Following a troubleshooting procedure for a DTC that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the brake system indicator (amber), and/or brake system indicator (red) came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.

2. When the brake system indicator (amber), or brake system indicator (red) does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. in the circuit indicated by the DTC.

3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the brake system indicator (amber) and brake system indicator (red) do not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicator(s) stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the electric servo brake control unit. If it does not, **go to the DTC troubleshooting index**

4. Check the diagnostic trouble code (DTC) and the freeze data, for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- Freeze data indicates the electric servo brake conditions when the first system malfunction that activated the indicator was detected.
- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

1. With the vehicle to the OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the electric servo brake control unit. If it does not, **go to the DTC troubleshooting index**

4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in the OFF (LOCK) mode, connect the HDS to the data link connector (DLC)

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the electric servo brake control unit. If it does not, go to the DTC troubleshooting index

4. Clear the DTC(s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

Components

The electric brake booster system consists of the following primary components:

- Electric brake booster
- Brake pedal stroke sensor
- System indicator

For locations of each component on the vehicle, **refer to Component Location Index**, and for indicator functions, **refer to How to Troubleshoot the Electric Brake Booster System**.

Electric Brake Booster

The electric brake booster consists of the brushless motor, control unit, transmission, rotary position sensor, brake pedal stroke sensor, and master cylinder.

The electric brake booster consists of the servo component, the servo control component, and the master cylinder component. The servo component consists of the motor, the transmission, and the valve body. The assisting force generated with the motor is transmitted to the valve body through the transmission, and an assist is performed because the valve body moves the piston of the master cylinder through the reaction disc.

The servo control component consists of the electric brake booster control unit, the rotary position sensor, and the brake pedal stroke sensor. The electric brake booster control unit measures the target differential stroke by using the brake pedal stroke sensor. The location of the plunger is calculated from the target differential stroke and the motor angle information (measured by the rotary position sensor). The master cylinder component is equivalent to a conventional vacuum brake booster brake system.

ELECTRIC BRAKE BOOSTER SYSTEM DESCRIPTION (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

Overview

The electric brake booster is an electromechanical brake booster that replaces a typical vacuum brake booster. This system provides stable braking performance that does not depend on vacuum supply.

The electric brake booster system consists of the following primary components:

- Electric brake booster
- Brake pedal stroke sensor
- System indicator

For locations of each component on the vehicle, **refer to Component Location Index**, and for functions of the indicator, **refer to How to Troubleshoot the Electric Brake Booster System**.

Construction

The electric brake booster consists of the servo component, the servo control component, and the master cylinder component. The servo component consists of the motor, the gear unit, and the boost body. The assisting force generated with the motor is transmitted to the boost body through the gear unit, and an assist is performed because the boost body moves the piston of the master cylinder through the reaction disc.

The servo control component consists of the electric brake booster control unit, the motor angle sensor, and the brake pedal stroke sensor. The electric brake booster control unit is calculating the location of the boost body from the motor angle information measured by the motor angle sensor. The location of the plunger is measured based on the signal from the brake pedal stroke sensor. The master cylinder component is equivalent to a conventional vacuum brake booster brake system.

Servo Control Operations

When the driver presses down the brake pedal, the master cylinder piston is pushed by the driver's pedal force via the input rod, the plunger, and the reaction disc. The plunger moves at this time, but the boost body connected with the motor through the gear unit does not move because the motor is not active. As a result, there is a difference between the relative position of the plunger and the boost body. The control unit drives the motor to generate the required assisting force which is calculated based on the relative position of the plunger and the boost body. The assisting force created by the movement of the boost body is transmitted via the reaction disc to the master cylinder piston.

Engine Starting Prohibition Condition

Vehicles equipped with the electric brake booster have starting restrictions. The engine may only start under the following conditions:

- Shift position/mode is P.
- Shift position/mode is N and parking brake is applied.

For more information, **refer to the Fuel and Emissions Construction and Function** .

System Wake-Up and Shutdown

The electric brake booster system is activated when the driver's door is opened while the vehicle is in the OFF (LOCK) mode or when the vehicle is turned to the ON mode.

To prevent excessive battery discharge, the system will shut down automatically 3 minutes after the driver's door was opened with the vehicle in the OFF (LOCK) mode. Once the driver's door is opened and the system is activated, the system's activation time will not be extended even if the door was opened again.

Activating and shutting down the system by the driver's door operation is as follows.

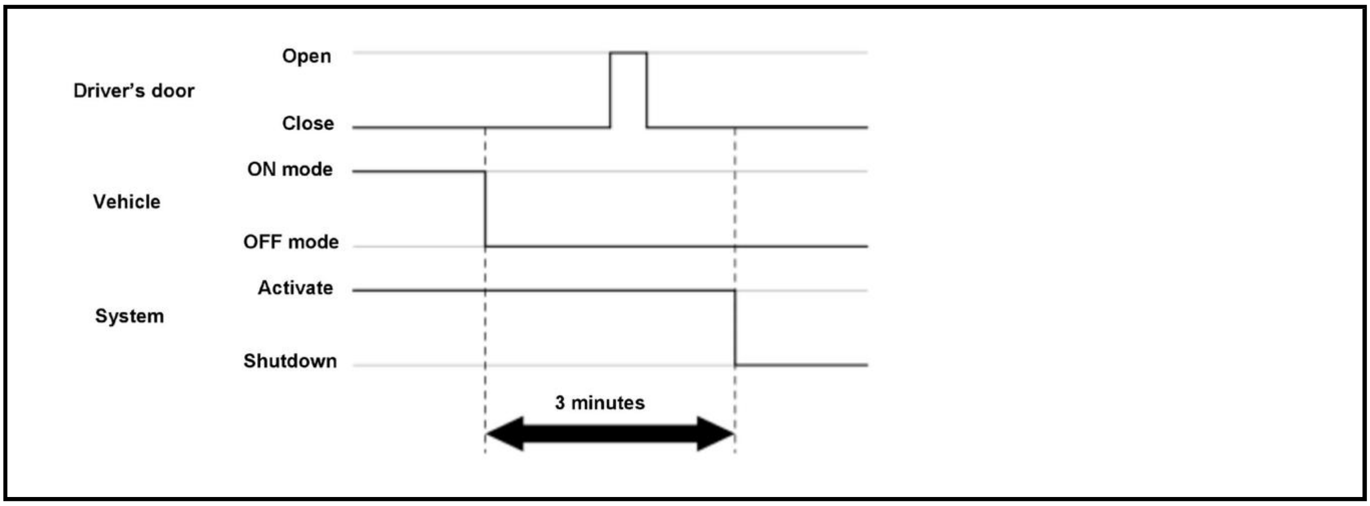
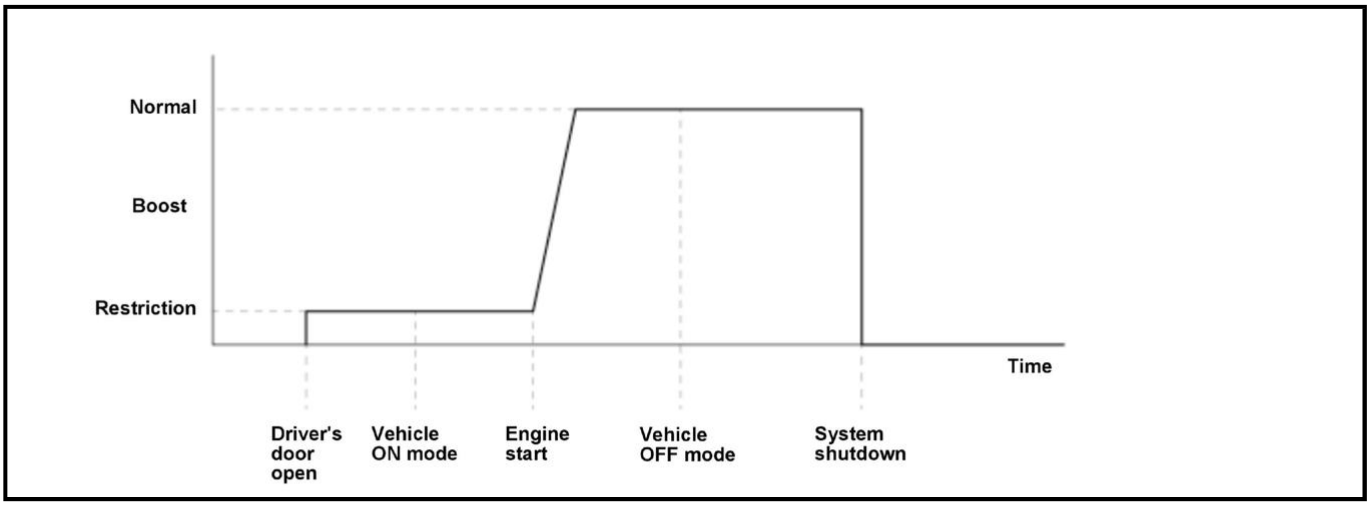
The system will shut down automatically 3 minutes after the vehicle is turned to the OFF (LOCK) mode, and the system's activation time will not be extended even if the door is opened.



Boost Restriction

When the system is activated by the driver's door operation, and the vehicle is stopped, a boost amount of electric brake booster is restricted. Under this condition, a boost amount is such that the brake pedal position switch can be turned ON. The boost restriction continues even after turning the vehicle to the ON mode, and the normal boost is started when the engine is started. Therefore, the driver may feel that the brake pedal is hard until the engine is started, but it is not a system fault. While the system is activated for 3 minutes after turning the vehicle to the OFF (LOCK) mode, the normal boost is maintained.



ELECTRIC BRAKE BOOSTER SYSTEM DESCRIPTION (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

Overview

The electric brake booster is an electromechanical brake booster that replaces a typical vacuum brake booster. This system provides stable braking performance that does not depend on vacuum supply.

The driver's brake pedal control is changed to the fluid pressure by the master cylinder and it's transmitted to the VSA modulator-control unit. The electric brake booster provides the assisting force created by the motor to the master cylinder input force. The system generates the braking force based on other control unit request. (Depending on the model)

Servo Control Operations

When the driver presses the brake pedal, the input rod and the plunger moves to the master cylinder piston side. The plunger moves at this time, but the valve body connected with the motor through the transmission, the spindle nut, and the spindle does not move because the motor is not active. As a result, there is a difference between the relative position of the plunger and the valve body. The control unit drives the motor to generate the required assisting force which is calculated based on the relative position of the plunger and the valve body.

The assisting force created by the movement of the valve body is transmitted via the reaction disc to the master cylinder piston.

Fail-safe

During the fail-safe mode, the driver's brake pedal operating force is transmitted via the reaction disc to the master cylinder piston directly. The hydraulic pressure created by the brake pedal force activates the brake caliper. In the fail-safe mode, the operating force of the brake pedal becomes higher than under normal conditions. To reduce the operating force of the brake pedal, the electric brake booster requests **hydraulic boost failure compensation control** to the VSA system.

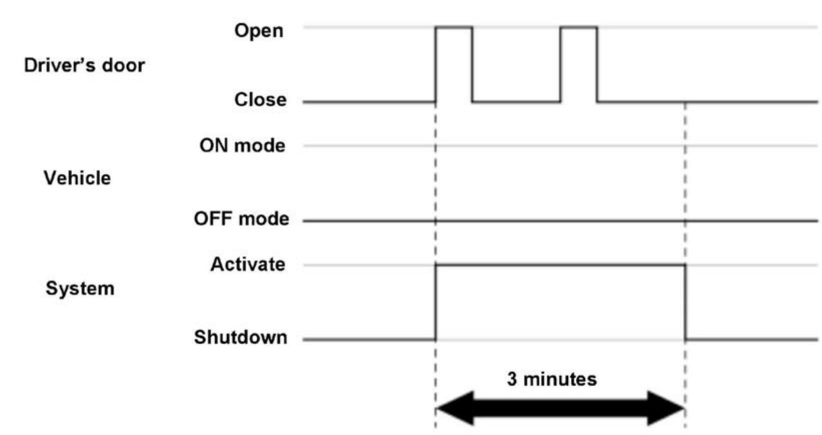
Open the driver's door again after the system is activated by opening the door

Once the driver's door is opened and the system is activated, the system's activation time will not be extended even if the door was opened again.



Open the driver's door after turning the vehicle to the OFF (LOCK) mode from ON mode

The system will shut down automatically 3 minutes after the vehicle is turned to the OFF (LOCK) mode, and the system's activation time will not be extended even if the door is opened.

DTC TROUBLESHOOTING

DTC C0049-7A (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C0049-7A : Brake Fluid Leak or Seal Failure

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- The DTCs may be indicated under these conditions:
-
    - -

      Bleed the brake system.
    - -

      Air trapped in the brake system.

DTC Description	DTC	Freeze Frame
C0049-7A Brake Fluid Leak or Seal Failure	B	B

DTC (Electric brake booster)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Start the engine.

-5. Press the brake pedal several times.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0049-7A Brake Fluid Leak or Seal Failure	B	B

Is DTC C0049-7A indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Brake fluid leakage check

-1. Press the brake pedal hard and hold for several seconds.

-2. **Inspect the brake system**.

Is there a fluid leakΩ

YES

Repair the brake fluid leak.

NO

Go to step 3.

3. Master cylinder check

-1. **Bleed the brake system**.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Start the engine.

-5. Press the brake pedal several times.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0049-7A Brake Fluid Leak or Seal Failure	B	B

Is DTC C0049-7A indicated?

YES

Replace the master cylinder .

NO

Troubleshooting is complete.

DTC C1250-98 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1250-98 : ECU Internal Malfunction (Over Temperature)

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C1250-98 ECU Internal Malfunction (Over Temperature)	B	B

DTC (Electric brake booster)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

   NOTE: Do not open and close the driver's door.

   -4. Turn the vehicle to the ON mode.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1250-98 ECU Internal Malfunction (Over Temperature)	B	B

   Is DTC C1250-98 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric brake booster check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Open the hood and cool the engine compartment for at least 10 minutes.

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-6. Turn the vehicle to the ON mode.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1250-98 ECU Internal Malfunction (Over Temperature)	B	B

Is DTC C1250-98 indicated?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Troubleshooting is complete.

DTC C1250-98 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

Is DTC C1250-98 indicated?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Troubleshooting is complete.

DTC C1C01-96 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1C01-96 : Brake Pedal Stroke Sensor Component Internal Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B

DTC (Electric brake booster)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B

Is DTC C1C01-96 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1C01-96 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B

DTC (Electric brake booster)

1. Problem verification 1

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B

Is DTC C1C01-96 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Go to step 2.

2. Problem verification 2

-1. Start the engine.

-2. Test-drive the vehicle without pressing the brake pedal for 1 minute or more.

NOTE: Drive the vehicle on the road, not on a lift.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait for 3 minutes or more.

NOTE: Do not open and close the driver's door.

Turn the vehicle to the ON mode, then wait for 1 minute or more.

NOTE:

- Do not open and close the driver's door.
- Do not press the brake pedal during 1 minute elapse.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C01-96 Brake Pedal Stroke Sensor Component Internal Failure	B	B

Is DTC C1C01-96 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1C02-11 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

DTC C1C02-11 : Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C02-11 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground	B	B

DTC (Electric brake booster)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C02-11 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC C1C02-11 indicated?

YES

If only C1C02-11 is indicated, go to step 2.

YES

If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS1 line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short to ground in the wire between the electric brake booster and the brake pedal stroke sensor.

3. Shorted wire check (PTS1 line to PTS GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 5**

Is there 1 MΩ or more?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair a short in the wire between the electric brake booster and the brake pedal stroke sensor.

DTC C1C02-12 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1C02-12 : Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C02-12 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery	B	B

DTC (Electric brake booster)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C02-12 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery	B	B

DTC Description	DTC	Freeze Frame
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC C1C02-12 indicated?

YES

If only C1C02-12 is indicated, go to step 2.

YES

If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS1 line to +B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 2**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 3.

3. Shorted wire check (PTS1 line to +B OPTION line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected

B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 4**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 4.

4. Shorted wire check (PTS1 line to IG1 OPTION line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 24**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 5.

5. Shorted wire check (PTS1 line to PTS VS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 11**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

DTC C1C02-14 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1C02-14 : Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground or Open

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C02-14 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground or Open	B	B

DTC (Electric brake booster)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

   NOTE: Do not open and close the driver's door.

   -4. Turn the vehicle to the ON mode.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C02-14 Brake Pedal Stroke Sensor Signal Circuit 1 Short To Ground or Open	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

   Is DTC C1C02-14 indicated?

   YES

   If only C1C02-14 is indicated, go to step 2.

   YES

   If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (PTS VS line)

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. **Remove the 12 volt battery** .

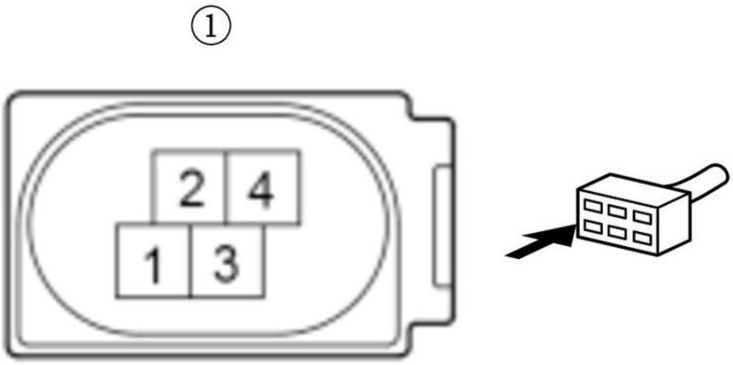
   -4. Disconnect the following connectors.

Electric brake booster 26P connector

Brake pedal stroke sensor 4P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 11**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 1: ①



Is there continuity?

YES

Go to step 3.

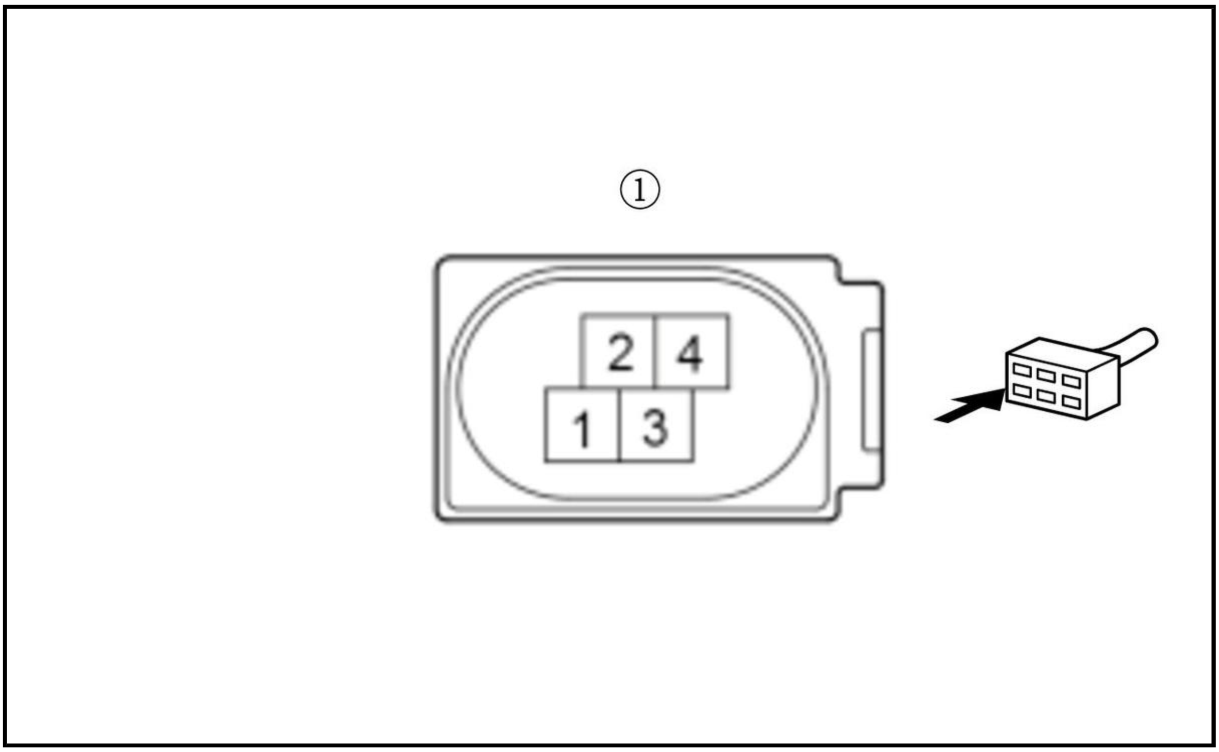
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

3. Open wire check (PTS GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 5**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 3: ①



Is there continuity?

YES

Go to step 4.

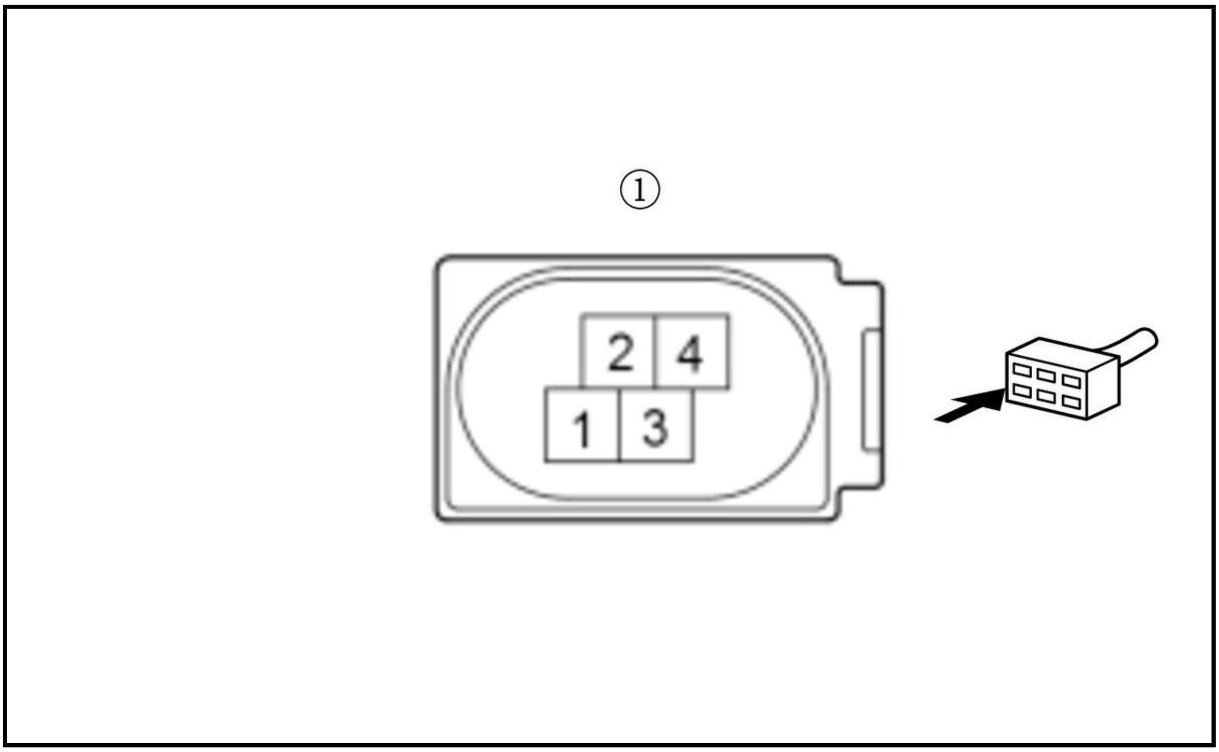
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

4. Open wire check (PTS1 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 2: ①



Is there continuity?

YES

Go to step 5.

NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

5. Shorted wire check (PTS1 line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 6.

6. Shorted wire check (PTS1 line to PTS GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector

B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 5**

Is there continuity?

YES

Repair a short in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

DTC C1C02-15 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE B) (2020 2021)

DTC C1C02-15 : Brake Pedal Stroke Sensor Signal Circuit 1 Short To Battery or Open

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C02-15 Brake Pedal Stroke Sensor Signal Circuit1 Short To Battery or Open	B	B

DTC (Electric brake booster)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C02-15 Brake Pedal Stroke Sensor Signal Circuit1 Short To Battery or Open	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC C1C02-15 indicated?

YES

If only C1C02-15 is indicated, go to step 2.

YES

If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS1 line to +B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 2**

Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

3. Shorted wire check (PTS1 line to IG1 OPTION line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector

B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 24**

Is there 1 MΩ or more?

YES

Go to step 4.

NO

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

4. Shorted wire check (PTS1 line to PTS VS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	**Electric brake booster 26P connector No. 11**

Is there 1 MΩ or more?

YES

Go to step 5.

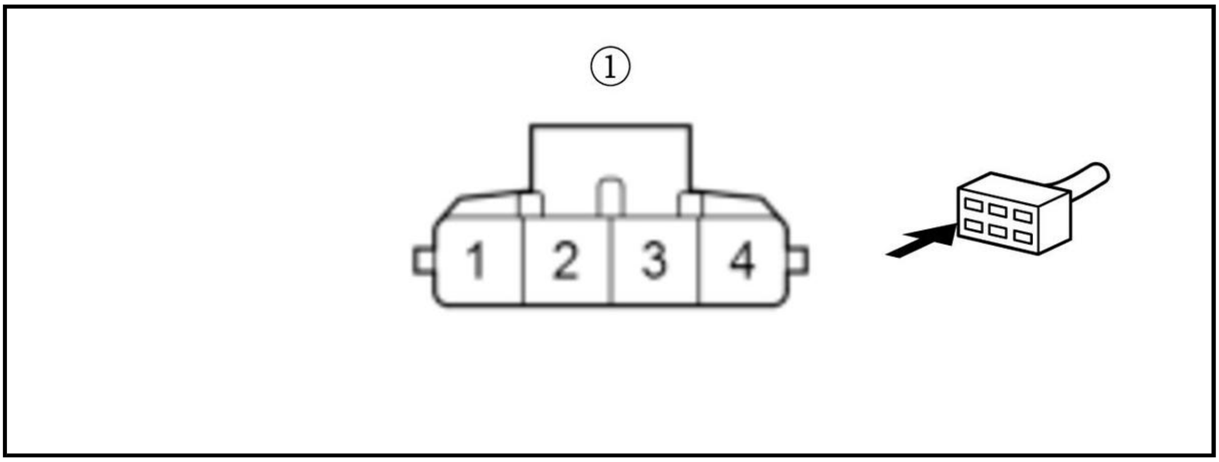
NO

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

5. Open wire check (PTS1 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 22**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

Go to step 6.

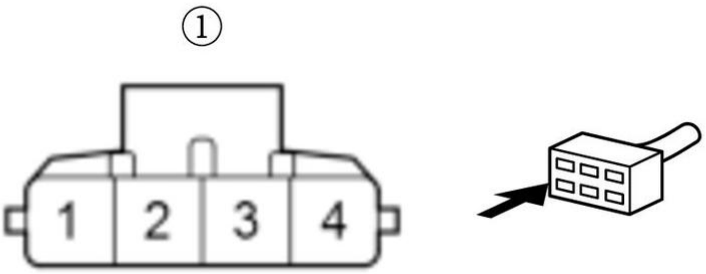
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

6. Open wire check (PTS VS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 11**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 7.

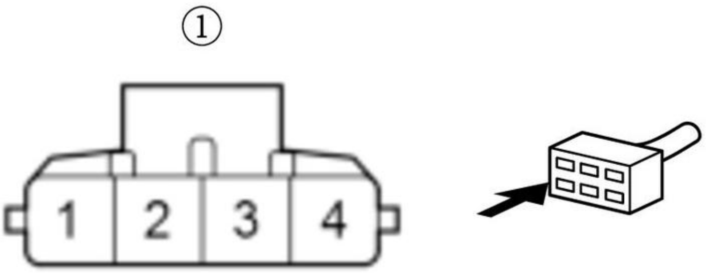
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

7. Open wire check (PTS GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 5**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

DTC C1C03-11 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A) (2017 2018 2019)

DTC C1C03-11 : Brake Pedal Stroke Sensor Signal Circuit 2 Short To Ground

NOTE: **Before you troubleshoot, review the general troubleshooting information**.

DTC Description	DTC	Freeze Frame
C1C03-11 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Ground	B	B

DTC (Electric brake booster)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C03-11 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Ground	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC C1C03-11 indicated?

YES

If only C1C03-11 is indicated, go to step 2.

YES

If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS2 line to ground)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 3.

3. Shorted wire check (PTS2 line to PTS GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	**Electric brake booster 26P connector No. 5**

Is there continuity?

YES

Repair a short in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

   Is DTC C1C03-11 indicated?

   YES

   If only C1C03-11 is indicated, go to step 2.

   YES

   If DTC C1C04-11 is also indicated, go to DTC C1C04-11.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS2 line to ground)

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. Remove the 12 volt battery .

   -4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

   -5. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	Body ground

Is there 1 MΩ or more?

YES

Go to step 3.

NO

Repair a short to ground in the wire between the electric brake booster and the brake pedal stroke sensor.

3. Shorted wire check (PTS2 line to PTS GND line)

-1. Measure the resistance between test points 1 and 2.

Is DTC C1C03-15 indicated?

YES

If only C1C03-15 is indicated, go to step 2.

YES

If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS2 line to +B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	**Electric brake booster 26P connector No. 2**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 3.

3. Shorted wire check (PTS2 line to +B OPTION line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	**Electric brake booster 26P connector No. 4**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 4.

4. Shorted wire check (PTS2 line to IG1 OPTION line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	**Electric brake booster 26P connector No. 24**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 5.

5. Shorted wire check (PTS2 line to PTS VS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	**Electric brake booster 26P connector No. 11**

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

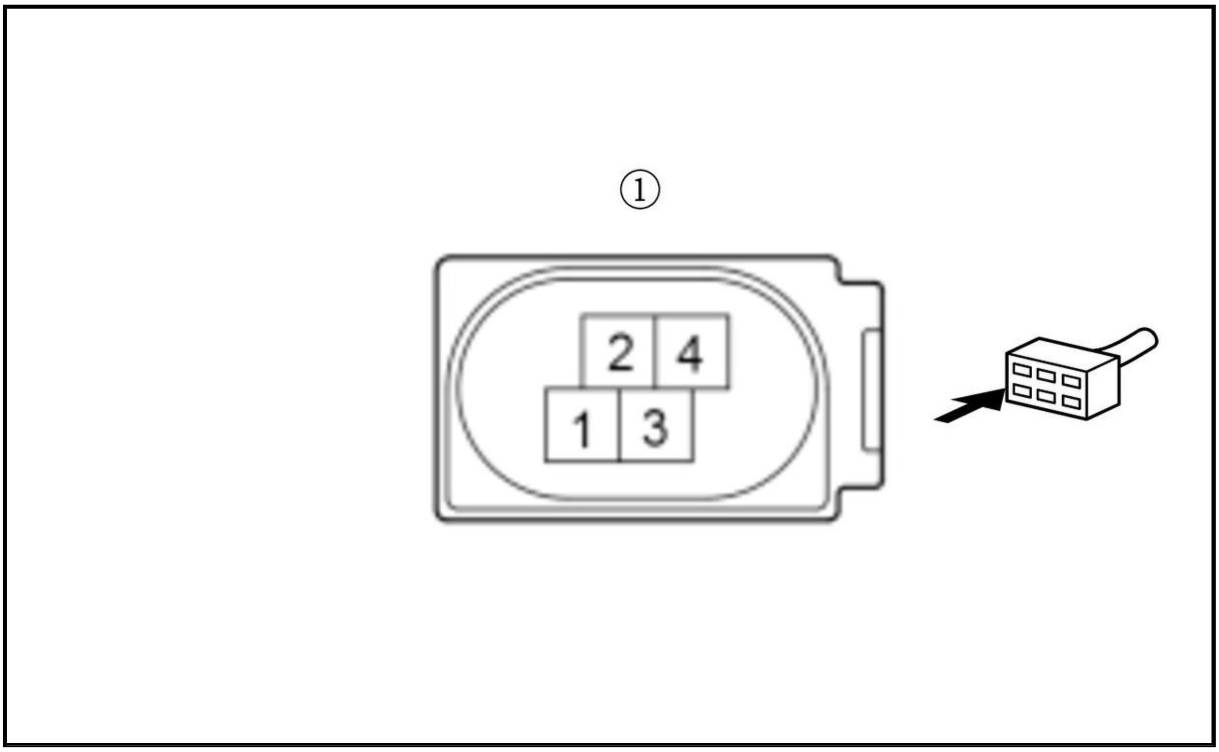
Go to step 6.

6. Open wire check (PTS2 line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**

Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 4: ①



Is there continuity?

YES

Go to step 7.

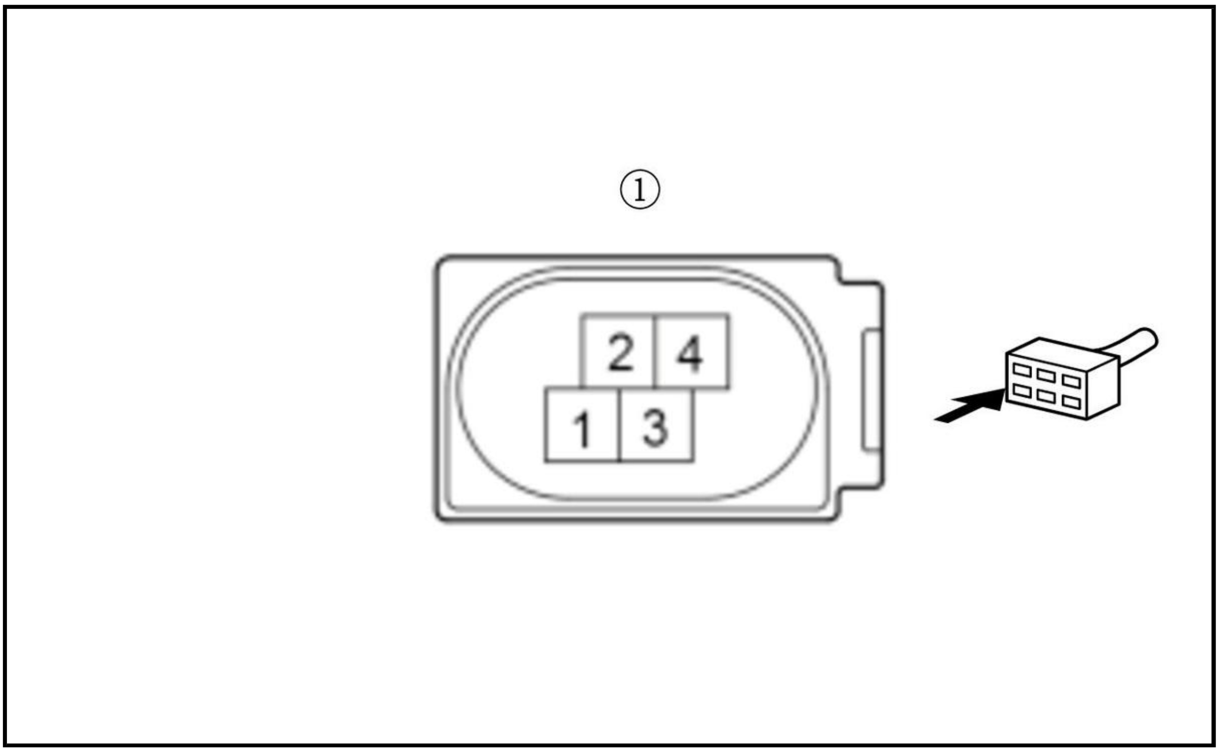
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

7. Open wire check (PTS VS line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 11**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 1: ①



Is there continuity?

YES

Go to step 8.

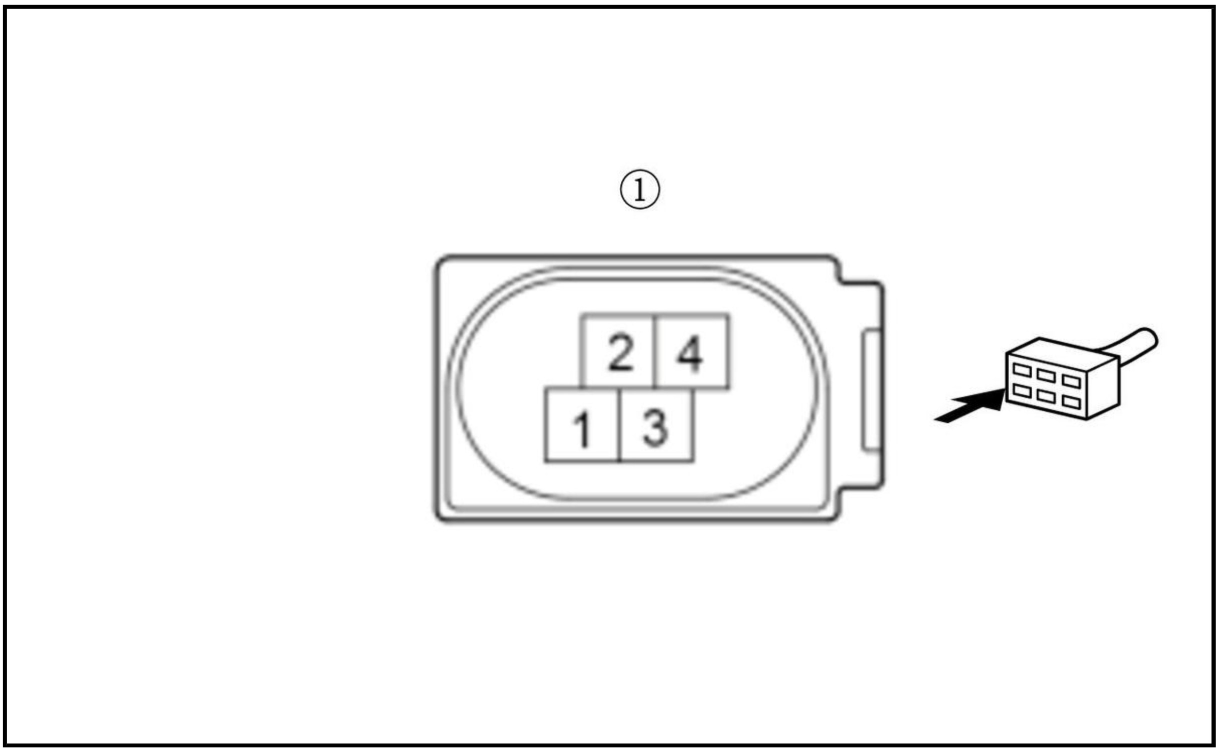
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

8. Open wire check (PTS GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 5**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 3: ①



Is there continuity?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the electric brake booster .

NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

NOTE: Before you troubleshoot, review the general troubleshooting information.

DTC Description	DTC	Freeze Frame
C1C03-15 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Battery or Open	B	B

DTC (Electric brake booster)

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C03-15 Brake Pedal Stroke Sensor Signal Circuit 2 Short To Battery or Open	B	B
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC C1C03-15 indicated?

YES

If only C1C03-15 is indicated, go to step 2.

YES

If DTC C1C04-11 is also indicated, **go to DTC C1C04-11**.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS2 line to +B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Electric brake booster 26P connector
Brake pedal stroke sensor 4P connector

-5. Measure the resistance between test points 1 and 2.

Test point 2	**Electric brake booster 26P connector No. 24**

Is there 1 MΩ or more?

YES

Go to step 4.

NO

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

4. Shorted wire check (PTS2 line to PTS VS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	**Electric brake booster 26P connector No. 11**

Is there 1 MΩ or more?

YES

Go to step 5.

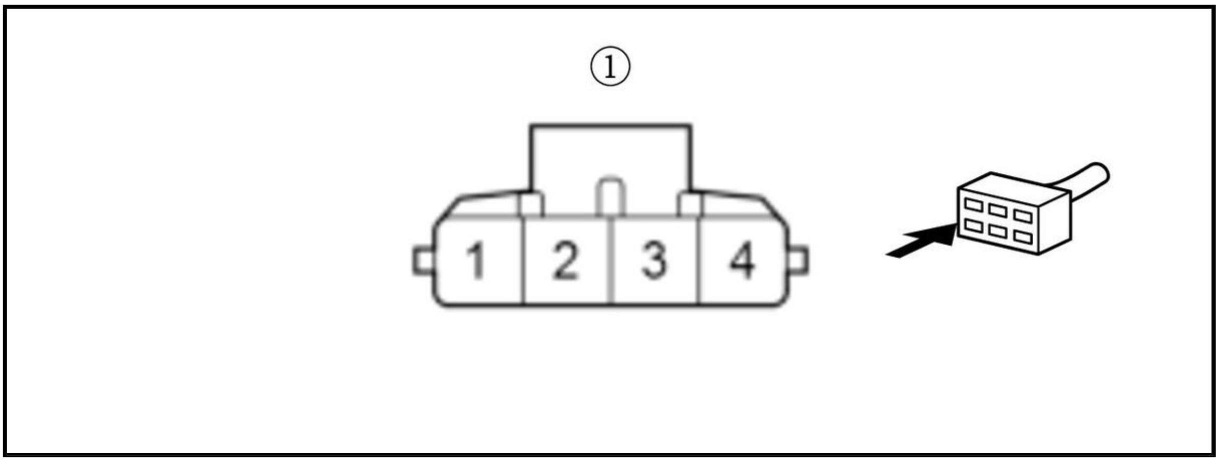
NO

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

5. Open wire check (PTS2 line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 21**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

Go to step 6.

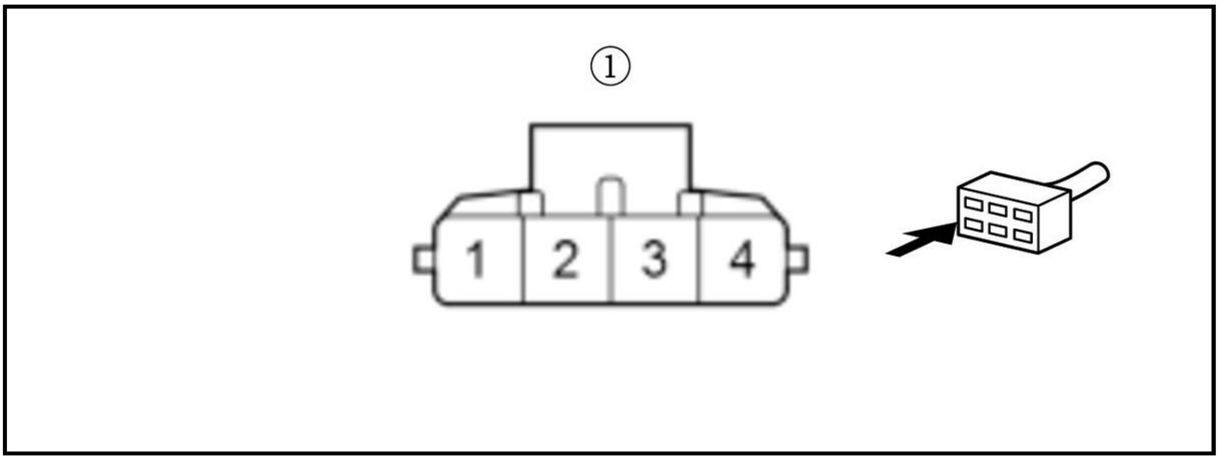
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

6. Open wire check (PTS VS line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 11**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 2: ①



Is there 1.0 Ω or less?

YES

Go to step 7.

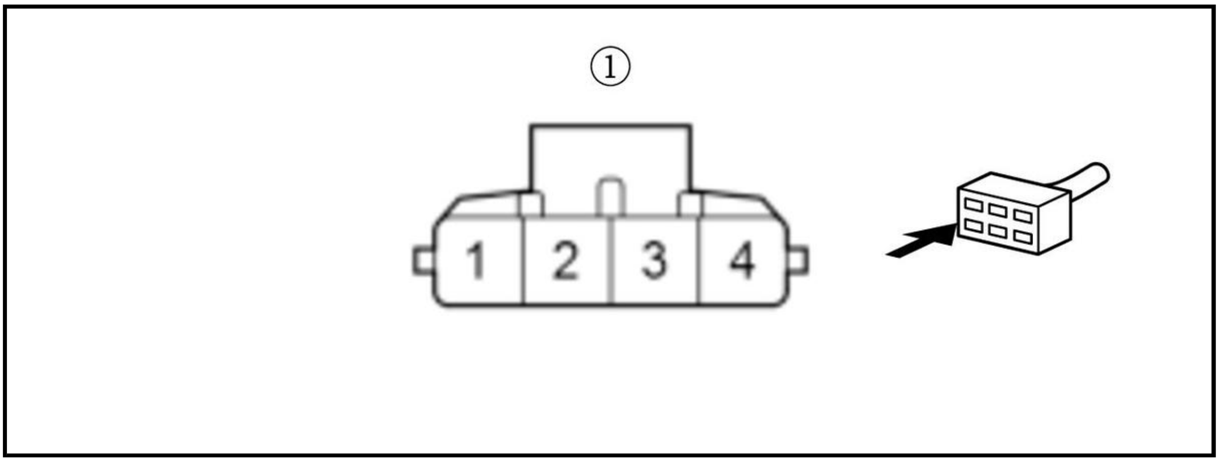
NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

7. Open wire check (PTS GND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 5**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair an open in the wire between the electric brake booster and the brake pedal stroke sensor.

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

NOTE: Do not open and close the driver's door.

-4. Turn the vehicle to the ON mode.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1C04-11 Brake Pedal Stroke Sensor Power Circuit Short To Ground or Battery	B	B

Is DTC C1C04-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (PTS VS line to +B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Remove the 12 volt battery** .

-4. Disconnect the following connectors.

Is there continuity?

YES

Repair a short to power in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 5.

5. Shorted wire check (PTS VS line to ground)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 11**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to ground in the wire between the electric brake booster and the brake pedal stroke sensor.

NO

Go to step 6.

6. Shorted wire check (PTS VS line to PTS GND line)

-1. Check for continuity between test points 1 and 2.

Test point 1	**Electric brake booster 26P connector No. 11**
Test point 2	**Electric brake booster 26P connector No. 5**

Is there 1 MΩ or more?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair a short in the wire between the electric brake booster and the brake pedal stroke sensor.

DTC U0029-00 (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A (WITHOUT CAN GATEWAY)) (2017 2018 2019)

DTC U0029-00 : CAN Communication Failure (Ch1 Bus OFF)

NOTE:

- **Before you troubleshoot, review the general troubleshooting information**.
- This DTC is stored by communication failure between the F-CAN line and the electric brake booster. When DTC U0029-00 is indicated, the F-CAN line has already returned to normal. Check for loose terminals and poor connections in the connectors. If the connectors are OK, clear the DTC and following this troubleshooting.

DTC Description	DTC	Freeze Frame
U0029-00 CAN Communication Failure (Ch1 Bus OFF)	B	B

DTC (Electric brake booster)

1. Electric brake booster communication check

-1. Turn the vehicle to the ON mode.

-2. Check for communication between the electric brake booster and the HDS.

Is there communication between the electric brake booster and the HDS?

YES

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

NO

Go to step 2.

2. Open wire check (F-CAN H, F-CAN L lines)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-4. Disconnect the following connectors.

Electric brake booster 26P connector

PCM connector A (51P)

-5. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected

Test circuit 2	B
Test point 1	**Electric brake booster 26P connector No. 18**
Test point 2	**PCM connector A (51P) No. 1**

Is there continuity?

YES

The F-CAN H and F-CAN L wires are OK. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair an open in the wire between the electric brake booster and the PCM.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Check the following fuse.

Fuse	No. A1-2 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A1-2 (40 A) fuse circuit.

3. Open wire check (+B EBB line)

-1. Disconnect the following connector.

Electric brake booster 26P connector

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair an open in the wire between the electric brake booster and the under-hood fuse/relay box.

DTC (Electric brake booster)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then wait 5 seconds or more.

   NOTE: Do not open and close the driver's door.

   -4. Turn the vehicle to the ON mode.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3003-16 Brake Booster Control Unit Power Circuit (+B) Low Voltage	B	B

   Is DTC U3003-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. Check the following fuse.

Fuse	**No. A1-2**

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 3.

   NO

   Replace the fuse. If the fuse blows again, repair a short to ground in the No. A1-2 fuse circuit.

3. Open wire check (+B EBB line)

-1. Disconnect the following connector.

2. Fuse check

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Check the following fuse.

Fuse	No. D5 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. D5 (10 A) fuse circuit.

3. Open wire check (IG1 OPTION line)

-1. Disconnect the following connector.

Electric brake booster 26P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode

NO

Repair an open in the wire between the electric brake booster and the under-dash fuse/relay box.

SERVICE INFORMATION

BRAKE SYSTEM INSPECTION AND TEST

Inspection

1. Brake System - Inspect

Inspect the brake system components listed. Repair or replace any parts that are leaking or damaged.

Component Inspections:

Component	Procedure	Also check for
Master cylinder	Look for damage or signs of fluid leakage at: • Reservoir or reservoir grommets. • Lines and their joints. • Between master cylinder and brake booster.	Bulging seal at reservoir cap. This is a sign of fluid contamination.
Brake hoses	Look for damage or signs of fluid leakage at: • Line joints and banjo bolt connections. • Hoses and lines, also inspect for twisting or damage.	Bulging, twisted, or bent lines.
Caliper	Look for damage or signs of fluid leakage at: • Piston seal. • Banjo bolt connections. • Bleed screw.	Seized or sticking caliper pins.
VSA modulator-control unit	Look for damage or signs of fluid leakage at: • Line joints. • Modulator-control unit.	B

Test

1. Brake System - Test

Brake pedal sinks/fades when braking

1. Set the parking brake, and start the engine, then turn off the A/C. Allow the engine to warm up to normal operating temperature (radiator fan comes on twice).

2. Make sure the steering column lock lever is in the locked position. Attach a 50 mm (1.97 in) piece of masking tape along the bottom of the steering wheel, and draw a horizontal reference mark across it.

3. With the transmission in P or N, press and hold the brake pedal lightly (about the same pressure needed to keep an A/T-equipped vehicle from creeping), then release the parking brake.

4. While still holding the brake pedal, hook the end of the tape measure behind the brake pedal, then pull the tape up to the steering wheel. Note the measurement between the brake pedal and the reference mark on the steering wheel.

5. Apply steady pressure to the brake pedal for 3 minutes.

6. Watch the tape measure.

- If the measurement increases 10 mm (0.39 in) or less, the master cylinder is OK.
- If the measurement increases more than 10 mm (0.39 in), replace the master cylinder .

CONVENTIONAL BRAKE SYSTEM BLEEDING

Bleeding

NOTE:

- **Review the Service Precautions before doing repairs or service**.
- There are three different methods used for bleeding brake systems. The method shown in this procedure is the preferred method for removing the air from the system. For pressure or vacuum bleeding, refer to the tool manufacturer's instructions included with the tool. If you use a commercially available pressure feed bleeder and operate the brake pedal, excessive hydraulic pressure will be applied to the cup inside the master cylinder causing damage. Do not use these methods together.
- When a rear brake caliper equipped with an electric parking brake is removed and installed, or overhauled (brake hose was disconnected), the bleeding procedure differs from the normal method. First, bleed the brakes using the normal procedure. Second, follow the procedure listed under rear caliper bleed. Third, bleed the brakes again using the normal procedure. This does not apply when the rear calipers are replaced.

NOTE:

- The reservoir connected to the master cylinder must be at the MAX (upper) level mark at the start of the bleeding procedure and checked after bleeding each wheel. Add fluid as required.
- Before beginning the bleeding procedure, remove the reservoir cap and strainer, and remove any dirt and debris then reinstall the strainer only.
- Bleed the brake system in the following order: front-driver's, front-passenger's, rear-passenger's, and rear-driver's.
- Unless indicated, the illustrations shown are examples only and may not match your vehicle.

1. **Vehicle - Lift**
2. Brake System - Normal Bleed

	**NOTE:** If a large amount of air is introduced into the system from a brake system component replacement, first drain the brake fluid into a container from each caliper by pumping the brake pedal slowly before starting the normal brake system bleed. 1. Attach a clear tube (A) to the bleed screw (B). 2. Submerge the other end of the clear tube into a clear plastic catch bottle of brake fluid (C). 3. Have an assistant slowly pump the brake pedal several times then apply steady continuous pressure. 4. Loosen the bleed screw slowly to bleed the fluid into the plastic catch bottle. The brake pedal will travel toward the floor as the fluid is bled from the system. 5. When the brake pedal reaches the floor, have the assistant hold the pedal in that position, then tighten the bleed screw. The brake pedal can now be released. 6. Repeat steps 3 thru 5 until the brake fluid in the clear drain tube appears fresh and there are no air bubbles in the fluid. **Then tighten the bleed screw to the specified torque** 7. Repeat this procedure for each caliper in the bleeding sequence.**NOTE:** If you removed and installed (brake hose was disconnected), or overhauled the rear caliper, also do the rear caliper bleed procedure.

3. Brake System - Rear Caliper Bleed

	**NOTE:** • When shaking the caliper body, be careful not to damage the electric parking brake actuator. • When bleeding the brake system, air can get trapped inside the rear calipers. This is due to the complex fluid path inside the electric parking brake calipers. Therefore this procedure is necessary. 1. **Remove the caliper assembly without disconnecting the brake hose from the caliper body** . 2. Tilt up the caliper body as shown and shake it.

	3. Tilt down the caliper body as shown and shake it again. 4. **Install the rear brake caliper body** 5. Bleed the rear brake again using the normal bleeding procedure.

TEST

BRAKE FLUID LEVEL SWITCH TEST

Test

NOTE: If both the ABS/VSA indicator and the brake system indicator (red) come on at the same time, **check the VSA system first** .

1. Brake Fluid Level Switch - Test

	1. Disconnect the connector (A). 2. Check for continuity between the terminals (1) and (2) with the float in the down position and in the up position. • Remove the brake fluid completely from the reservoir. With the float down, there should be continuity. • Fill the reservoir with brake fluid to the MAX (upper) level (B). With the float up, there should be no continuity. **NOTE:** If the brake fluid level switch is OK, but the brake system indicator (red) does not function, **do the**

	gauge control module self-diagnostic function . 3. Connect the connector.

INSPECTION

BRAKE HOSE AND LINE INSPECTION

Inspection

1. Brake Hose and Line - Inspect
    1. Inspect the brake hoses for damage, deterioration, leaks, interference, and twisting.
    2. Check the brake lines for damage, rusting, and leaks. Also check for bent brake lines.
    3. Check for leaks at hose and line joints and connections, and retighten if necessary.
    4. Check the master cylinder and the VSA modulator-control unit for damage and leaks.

BRAKE MASTER CYLINDER INSPECTION (WITH ELECTRIC BRAKE BOOSTER TYPE A (KA/KC)) (2017 2018 2019)

Inspection

1. Master Cylinder - Inspect

   NOTE:

   - **Review the Service Precautions before doing repairs or service**.
   - There are two types of electric brake boosters (type A or B) that can be differentiated visually. **Make sure which booster type is equipped before doing any repairs or service**.
   - Do not try to disassemble the master cylinder. Replace the master cylinder with a new part if necessary.
   - Check for deterioration and damage to each part during removal.

GENERAL INFORMATION

CONVENTIONAL BRAKE SERVICE PRECAUTIONS

Check the following precautions when handling the brake fluid and brake parts.

Handling the Brake Fluid

NOTE:

Do not spill brake fluid on the vehicle; it may damage the paint. If brake fluid does contact the paint, wash it off immediately with water.

- Brake fluid is poisonous. If ingested, get medical attention immediately.
- Use recommend new genuine Acura or Honda Brake Fluid from an unopened container. Using a non-Acura or non-Honda brake fluid can cause corrosion and shorten the life of the system.
- Do not reuse drained brake fluid.
- Make sure no dirt or other foreign matter gets into the brake fluid.

Handling the Brake Parts

WARNING: **Frequent inhalation of brake pad dust, regardless of material composition, could be hazardous to your health.**

- Avoid breathing dust particles.
- Never use a compressed air gun (unless specified) to clean brake assemblies. Use an OSHA-approved vacuum cleaner.

- Clean all parts with brake cleaner and air dry.
- Before reassembling, check that all the parts are free of dirt and other foreign particles.
- During brake caliper removal, to prevent damage to the caliper assembly or brake hose, use a short piece of wire to hang the caliper assembly from the undercarriage. After installation, check the brake hoses for interference and twisting.
- Be careful when pressing or moving the piston back in the caliper; brake fluid might overflow from the master cylinder's reservoir. If brake fluid gets on any painted surface, wash it off immediately with water.
- Before installing the brake disc or the brake drum clean the mating surfaces between the hub or hub bearing unit and the inside of the brake disc or the brake drum.
- Make sure no grease or oil gets on the brake discs, the brake drums, the brake pads, or the brake shoes.
- Be careful not to bend, damage, or deform the brake lines.
- After removing the brake hoses and the brake lines, plug the ends of the hoses and the joints to prevent spilling brake fluid.
- Replace parts with new ones whenever specified to do so.

Electric brake booster type

There are two types of electric brake boosters (type A or B) depending on the model year that can be differentiated visually.

SYMPTOM TROUBLESHOOTING

BRAKE SYSTEM SYMPTOM TROUBLESHOOTING - RAPID BRAKE PAD WEAR, VEHICLE VIBRATION (AFTER A LONG DRIVE), OR HIGH, HARD BRAKE PEDAL

Rapid brake pad wear, vehicle vibration (after a long drive), or high, hard brake pedal

NOTE: Make sure that the caliper pins are installed correctly. The upper caliper pin and the lower caliper pin are different. If these caliper pins are installed in the wrong location, it will cause vibration, uneven or rapid brake pad wear, and possibly uneven tire wear. See the proper caliper pin location:

- **Front caliper**
- **Rear caliper**

1. Electric brake booster system check

   -1. Turn the vehicle to the ON mode.

   -2. Check the brake system indicator (red) and the brake system indicator (amber) for several seconds when the vehicle to the ON mode.

   Do the indicators come on then go off?

   YES

   Go to step 2.

NO

Go to electric brake booster system troubleshooting.

2. Electric parking brake system check

   -1. Turn the vehicle to the OFF (LOCK) mode, then the ON mode.

   -2. Check the brake system indicator (red) and the brake system indicator (amber) for several seconds when the vehicle to the ON mode.

   Do the indicators come on then go off?

   YES

   Go to step 3.

   NO

   Go to electric parking brake system troubleshooting .

3. Brake system check

   -1. Drive the vehicle to note if the brakes drag or the pedal becomes high and hard. This may take 20 or more brake pedal applications during an extended test-drive.

   -2. With the engine running, **raise and support the vehicle** , and spin all four wheels by hand.

   Is there brake drag at any of the wheels?

   YES

   Go to step 4.

   NO

   Look for other causes of pad wear, high pedal, or vehicle vibration.

4. Brake pedal position switch check

   -1. Without removing the brake lines, unbolt and separate the master cylinder from the brake booster, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES

   Go to step 5.

   NO

   Check the brake pedal position switch adjustment and pedal free play .

5. Master cylinder check

   -1. Loosen the hydraulic lines at the master cylinder, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES

Go to step 6.

NO

Check the master cylinder reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid, then replace all rubber parts in the brake system that were exposed to contaminated fluid. If the brake fluid is OK, **replace the master cylinder** .

6. Caliper check

   -1. Loosen the bleed screws at each caliper, then spin the wheels to check for brake drag.

   Is there brake drag at any of the wheels?

   YES

   Check the master cylinder reservoir for contamination in the brake fluid. If you find contamination, flush the entire brake system of all contaminated fluid, then replace all rubber parts in the brake system that were exposed to contaminated fluid. If the brake fluid is OK, disassemble and repair the caliper or wheel cylinder on the wheel (s) with brake drag.

   NO

   Look for and replace any damaged brake lines. If all brake lines are OK, **replace the VSA modulator-control unit** .

ELECTRIC BRAKE BOOSTER SYSTEM SYMPTOM TROUBLESHOOTING - BRAKE SYSTEM INDICATOR (RED) AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A (WITH CAN GATEWAY)) (2017 2018 2019)

Brake system indicator (red) and brake system indicator (amber) do not go off

1. DTC check (Electric brake booster)

   -1. Turn the vehicle to the ON mode.

   -2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

   Is DTC indicated?

   YES

   Go to indicated DTC's troubleshooting.

   NO

   Go to step 2.

2. DTC check (CAN gateway system)

   -1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

   Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. Gauge control module operation check

-1. Do the gauge control module self-diagnostic function .

Is the gauge control module OK?

YES

Go to step 4.

NO

Replace the gauge control module .

4. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Check the following fuse.

Fuse	No. A1-2 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A1-2 (40 A) fuse circuit.

5. Fuse check 2

-1. Check the following fuse.

Fuse	No. D24 (5 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. D24 (5 A) fuse circuit.

6. Fuse check 3

-1. Check the following fuse.

Fuse	No. D5 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 7.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D5 (10 A) fuse circuit.

7. Open wire check (IG1 OPTION line)

-1. Disconnect the following connector.

Electric brake booster 26P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 24**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 OPTION wire is OK. Go to step 8.

NO

Repair an open in the wire between the under-dash fuse/relay box and the electric brake booster.

8. Open wire check (+B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B EBB wire is OK. Go to step 9.

NO

Repair an open in the wire between the under-hood fuse/relay box and the electric brake booster.

9. Open wire check (+B OPTION line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 4**
Test point 2	Body ground

Is there battery voltage?

YES

The +B OPTION wire is OK. Go to step 10.

NO

Repair an open in the wire between the under-dash fuse/relay box and the electric brake booster.

10. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 1**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 11.

NO

Repair an open in the wire between the electric brake booster and body ground (G351).

11. F-CAN circuit communication check

-1. Reconnect the following connector.

Electric brake booster 26P connector

-2. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Gauge control module (Bus A) is Not Available

Go to step 12.

Electric brake booster (Bus A) is Not Available

Go to step 13.

Electric brake booster (Bus B) is Not Available

Go to step 14.

Electric brake booster and gauge control module are Available

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting**.

12. Open wire check (F-CAN A H, F-CAN A L lines)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

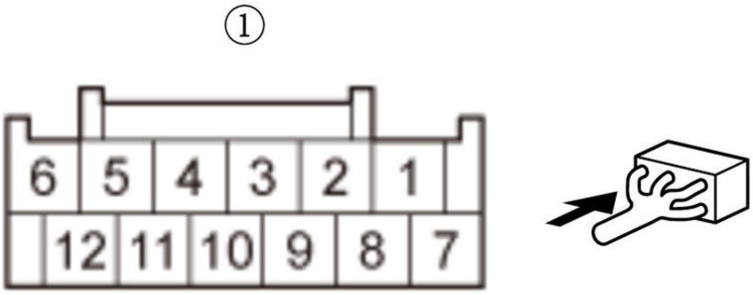
-3. Disconnect the following connectors.

Gauge control module connector A (32P)
CAN gateway 12P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	CAN gateway 12P connector: disconnected
Test circuit 1	B
Test point 1	**Gauge control module connector A (32P) No. 19**
Test point 2	CAN gateway 12P connector (female terminals) No. 3: ①

Test circuit 2	B
Test point 1	**Gauge control module connector A (32P) No. 20**
Test point 2	CAN gateway 12P connector (female terminals) No. 9: ①



Is there continuity?

YES

The F-CAN A H and F-CAN A L wires are OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the gauge control module and the CAN gateway.

13. Open wire check (F-CAN A H, F-CAN A L lines)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connectors.

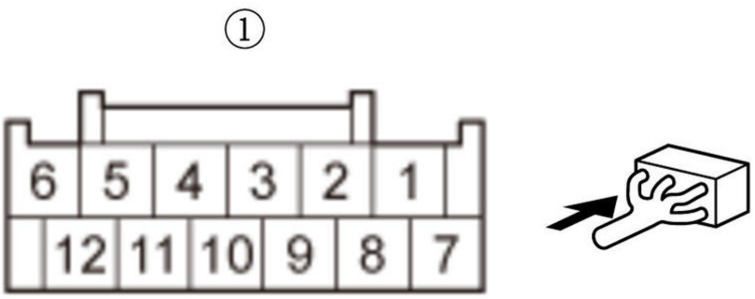
Electric brake booster 26P connector
CAN gateway 12P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
B	CAN gateway 12P connector: disconnected
Test circuit 1	B
Test point 1	**Electric brake booster 26P connector No. 26**
Test point 2	CAN gateway 12P connector (female terminals) No. 3: ①

Test circuit 2	B

Test point 1	**Electric brake booster 26P connector No. 18**
Test point 2	CAN gateway 12P connector (female terminals) No. 9: ①



Is there continuity?

YES

The F-CAN A H and F-CAN A L wires are OK. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the electric brake booster .

NO

Repair an open in the wire between the electric brake booster and the CAN gateway.

14. Open wire check (F-CAN B H, F-CAN B L lines)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connectors.

Electric brake booster 26P connector
CAN gateway 12P connector

-4. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
B	CAN gateway 12P connector: disconnected
Test circuit 1	B
Test point 1	**Electric brake booster 26P connector No. 19**

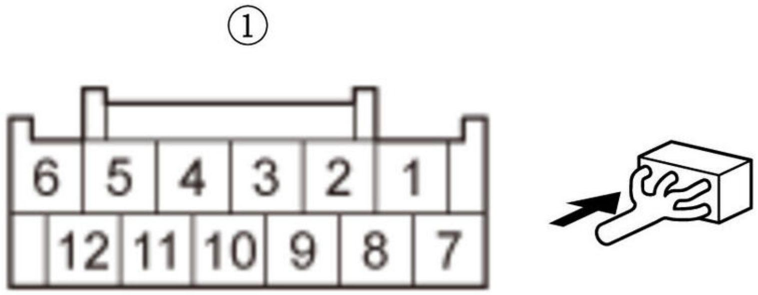
Test circuit 2	B
Test point 1	**Electric brake booster 26P connector No. 12**
Test point 2	CAN gateway 12P connector (female terminals) No. 5: ①



Is there continuity?

YES

The F-CAN B H and F-CAN B L wires are OK. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the electric brake booster .

NO

Repair an open in the wire between the electric brake booster and the CAN gateway.

ELECTRIC BRAKE BOOSTER SYSTEM SYMPTOM TROUBLESHOOTING - BRAKE SYSTEM INDICATOR (RED) AND BRAKE SYSTEM INDICATOR (AMBER) DO NOT GO OFF (ELECTRIC BRAKE BOOSTER CONTROL UNIT TYPE A (WITHOUT CAN GATEWAY)) (2017 2018 2019)

Brake system indicator (red) and brake system indicator (amber) do not go off

1. DTC check (Electric brake booster)

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 2.

2. Gauge control module operation check

-1. Do the gauge control module self-diagnostic function .

Is the gauge control module OK?

YES

Go to step 3.

NO

Replace the gauge control module .

3. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Check the following fuse.

Fuse	No. A1-2 (40 A)
Location	Under-hood fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A1-2 (40 A) fuse circuit.

4. Fuse check 2

-1. Check the following fuse.

Fuse	No. D24 (5 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 5.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. D24 (5 A) fuse circuit.

5. Fuse check 3

-1. Check the following fuse.

Fuse	No. D5 (10 A)
Location	Under-dash fuse/relay box

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 6.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D5 (10 A) fuse circuit.

6. Open wire check (IG1 OPTION line)

-1. Disconnect the following connector.

Electric brake booster 26P connector

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 24**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1 OPTION wire is OK. Go to step 7.

NO

Repair an open in the wire between the under-dash fuse/relay box and the electric brake booster.

7. Open wire check (+B EBB line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 2**
Test point 2	Body ground

Is there battery voltage?

YES

The +B EBB wire is OK. Go to step 8.

NO

Repair an open in the wire between the under-hood fuse/relay box and the electric brake booster.

8. Open wire check (+B OPTION line)

-1. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 4**
Test point 2	Body ground

Is there battery voltage?

YES

The +B OPTION wire is OK. Go to step 9.

NO

Repair an open in the wire between the under-dash fuse/relay box and the electric brake booster.

9. Open wire check (GND line)

-1. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
Test point 1	**Electric brake booster 26P connector No. 1**
Test point 2	Body ground

Is there continuity?

YES

The GND wire is OK. Go to step 10.

NO

Repair an open in the wire between the electric brake booster and body ground (G351).

10. Open wire check (F-CAN H, F-CAN L lines)

-1. Disconnect the following connector.

Gauge control module connector A (32P)

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric brake booster 26P connector: disconnected
B	Gauge control module connector A (32P): disconnected

Test circuit 2	B
Test point 1	**Electric brake booster 26P connector No. 18**
Test point 2	**Gauge control module connector A (32P) No. 20**

Is there continuity?

YES

The F-CAN H and F-CAN L wires are OK. Check for loose terminals and poor connections in the electric brake booster 26P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric brake booster** .

NO

Repair an open in the wire between the electric brake booster and the gauge control module.

1. All DTCs check

-1. All DTCs check with the HDS.

All DTCs

Are there DTCs indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 2.

2. Fuse check 1

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Check the following fuse.

Fuse	**No. A1-2**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A1-2 fuse circuit.

3. Fuse check 2

-1. Check the following fuse.

Fuse	**No. D5**

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 4.

NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair a short to ground in the No. D5 fuse circuit.

4. Open wire check (IG1 OPTION line)

-1. Disconnect the following connector.

ELECTRIC BRAKE BOOSTER SYSTEM SYMPTOM TROUBLESHOOTING INDEX

When the vehicle has one of these symptoms, check for electric brake booster diagnostic trouble codes (DTCs) with the HDS. If there are no DTCs, do the diagnostic procedure for the symptom, in the sequence listed, until you find the cause.

Symptom	Diagnostic procedure	Also check for

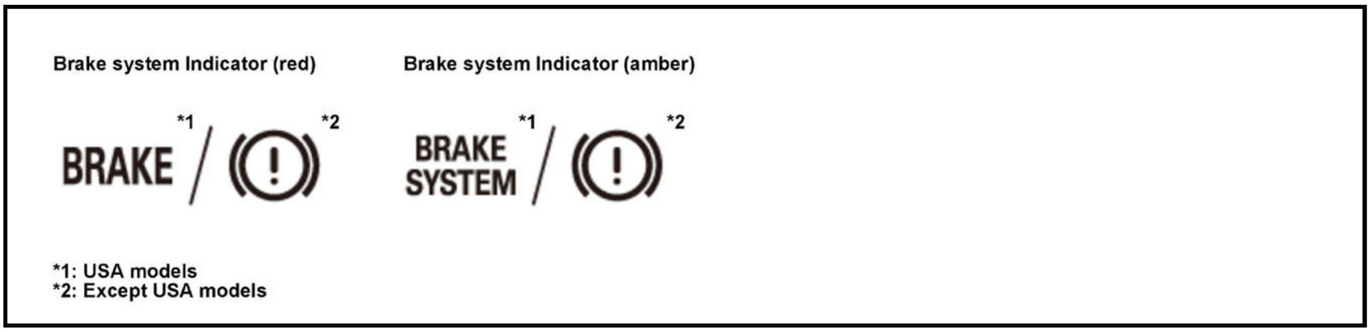
HOW TO INFORMATION

HOW TO TROUBLESHOOT THE ELECTRIC BRAKE BOOSTER SYSTEM

System Indicator

This system has two indicators on the gauge control module.



NOTE: For locations of each indicator, refer to gauge control module component location index.

When the system is OK, each indicator comes on for about 2 seconds after turning the vehicle to the ON mode, then it goes off.

When the system detects a problem, a DTC will set and depending upon the failure, the electric brake booster determines which indicator (s) will turn on. If the problem goes away (system returns to normal), the indicator (s) will be controlled in the following way depending upon the DTC that was set:

- The indicator (s) will come on and stay on when turning the vehicle to the ON mode.
- The indicator (s) will automatically go off.
- The indicator (s) will go off after the vehicle is driven.

Brake System Indicator (Red)

The brake system indicator (red) comes on when the electric brake booster servo control is lost, the EBD function is lost, the parking brake is applied, and/or the brake fluid level is low.

NOTE: If two or more wheel speed sensors fail, the brake system indicator (red) will come on along with the VSA indicator.

Brake System Indicator (Amber)

The brake system indicator (amber) comes on, when the brake control system is lost.

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in ascending order, not in the order they occurred.
- The DTCs are memorized in an EEPROM in the electric brake booster. Therefore, the memorized DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

- Self-diagnosis can be classified into two categories:
-
    - -

      Initial diagnosis: Done right after the vehicle turned to the ON mode and until the brake system indicator (red) and the brake system indicator (amber) go off.
-
    - -

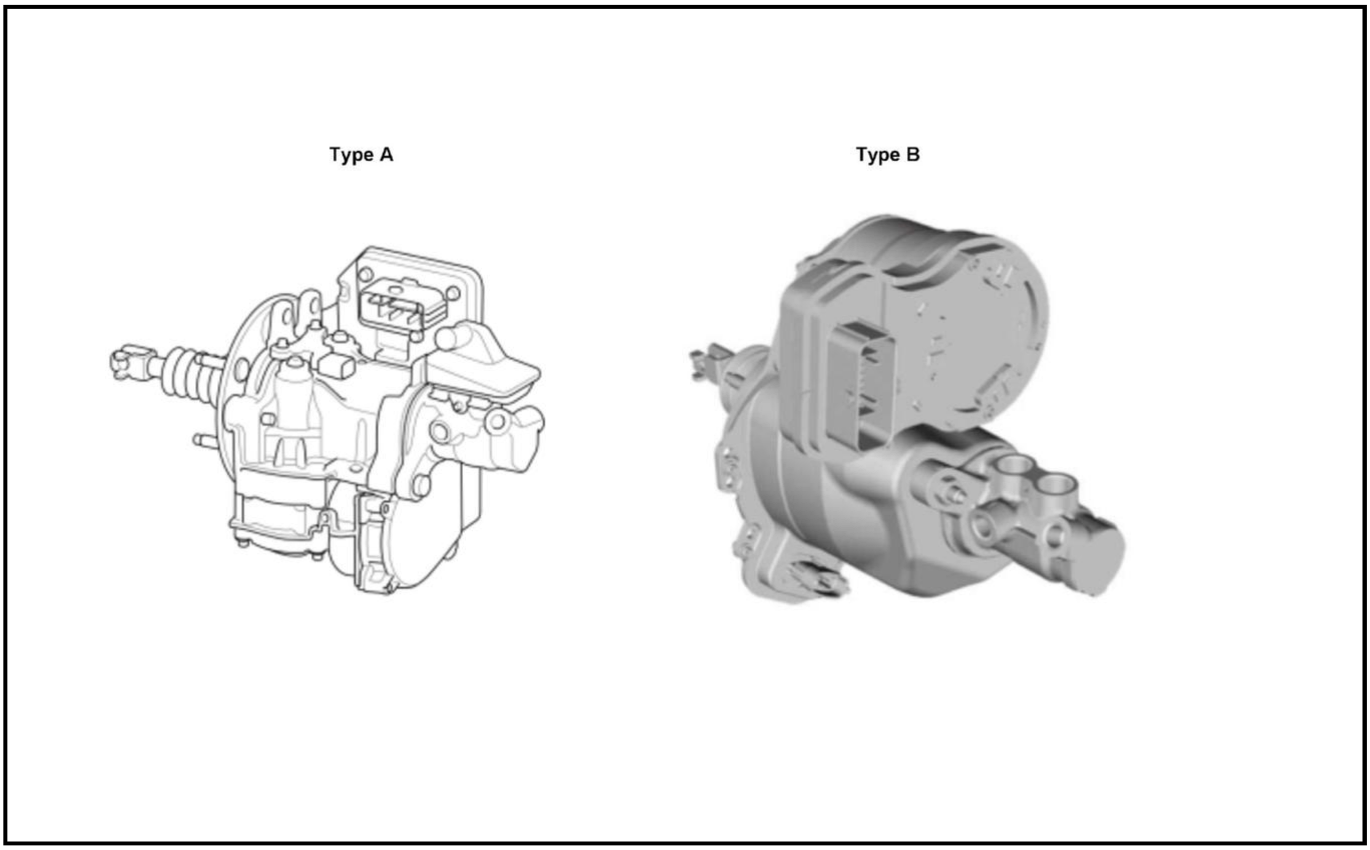
      Regular diagnosis: Done right after the initial diagnosis until turning the vehicle to the OFF (LOCK) mode.
- When the system detects a problem, the electric brake booster shifts to fail-safe mode.

Hydraulic Boost Failure Compensation

This vehicle is equipped with a hydraulic boost failure compensation. This hydraulic boost failure compensation uses the VSA modulator-control unit's pressurization control to provide additional brake assist. This is necessary when the electric brake booster system is lost. The hydraulic boost failure compensation can be heard when operating and some kickback will be felt on the brake pedal. The hydraulic boost failure compensation may also be activated in some high altitude conditions. These are considered normal characteristics of this system.

How to Discriminate the Type of the Electric Brake Booster

The type of the electric brake booster can be discriminated between type A and type B as shown.



How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the brake system indicator (red), and/or brake system indicator (amber) are still on. Following a troubleshooting procedure for a DTC that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the brake system indicator (red), and/or brake system indicator (amber) came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.

2. When the brake system indicator (red) or brake system indicator (amber) does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. in the circuit indicated by the DTC.

3. After troubleshooting, or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the brake system indicator (red) and brake system indicator (amber) do not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicator (s) stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the electric brake booster. If it does not, **go to the F-CAN circuit troubleshooting**

4. Check the diagnostic trouble code (DTC) and the freeze data, for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- Freeze data indicates the electric servo brake system conditions when the first system malfunction that activated the indicator was detected.
- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the HDS Help menu.

How to Retrieve DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the electric brake booster. If it does not, **go to the F-CAN circuit troubleshooting**

4. Follow the prompts on the HDS to display the DTC (s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle and the electric brake booster. If it does not, **go to the F-CAN circuit troubleshooting**

4. Clear the DTC (s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

Inspection

NOTE: How to read the torque specifications .

1. **Vehicle - Lift**
2. **Front Wheels - Remove**
3. **Brake Pad - Remove**
4. Front Brake Disc Thickness and Parallelism - Inspect

 	1. Using a micrometer (A), measure the brake disc thickness at eight points, about 45 deg. apart and 10 mm (0.39 in) in from the outer edge of the brake disc. Replace the brake disc if the smallest measurement is less than the maximum refinishing limit. * This is the maximum allowable difference between the thickness measurements. 2. If the brake disc is beyond the service limit for parallelism, refinish the brake disc with a Honda-approved commercially available on-car brake lathe. **NOTE:** - If the brake disc is beyond the service limit for refinishing, replace it. - For more information on Honda-approved brake lathes, refer to any authorized service information related brake disc refinishing (if available). 3. Inspect the brake disc runout.

B	1. Inspect the brake disc to wheel surface for damage and cracks. 2. Clean the brake disc thoroughly, and remove all rust. 3. Install suitable flat washers (A) and the wheel nuts (B). 4. Tighten the wheel nuts to the specified torque to hold the brake disc securely against the hub. 5. Set up the dial gauge (C) against the brake disc as shown. 6. Measure the runout at 10 mm (0.39 in) from the outer edge of the brake disc. 7. If the brake disc is beyond the service limit, refinish the brake disc with a Honda-approved commercially available on-car brake lathe. **NOTE:** • If the brake disc is beyond the service limit for refinishing, replace it. • If the brake disc is replaced with a new one, check the new disc for runout. If the new disc is out of specification, refinish the disc. • For more information on Honda-approved brake lathes, refer to any authorized service information related brake disc refinishing (if available).

Removal

NOTE: **Review the Service Precautions before doing repairs or service**.

1. Brake Fluid - Remove

1. Remove some brake fluid from the reservoir.

2. **Vehicle - Lift**
3. **Front Wheels - Remove**
4. Brake Pad - Remove

	1. Remove the brake hose mounting bolt (A). 2. Remove the flange bolt (B) while holding the caliper pin (C). **NOTE:** Be careful not to damage the pin boot. 3. Pivot the caliper body (D) up out of the way. **NOTE:** Check the hose and the pin boots for damage and deterioration.

	4. Remove the pad shims (A) and the brake pads (B). **NOTE:** Be careful not to damage or deform the pad return springs (C). 5. Remove the pad retainers (D). **NOTE:** The upper and lower pad retainers are different. During installation, make sure the pad retainers are in the proper positions. 6. Clean the caliper bracket (E) thoroughly; remove any rust, and check for grooves and cracks. 7. Verify that the caliper pins (F) move in and out smoothly. Clean and lube if needed.

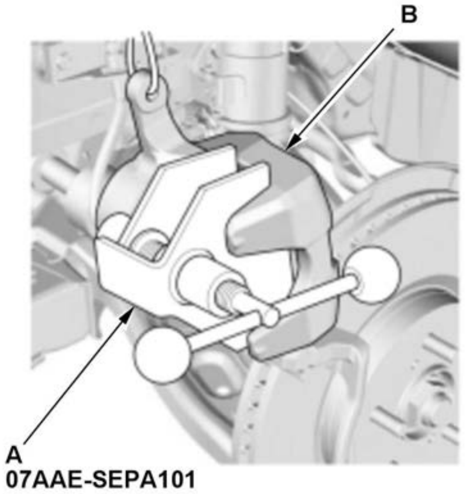
5. Brake Disc - Inspect

Installation

NOTE:

- How to read the torque specifications .
- Review the Service Precautions before doing repairs or service.

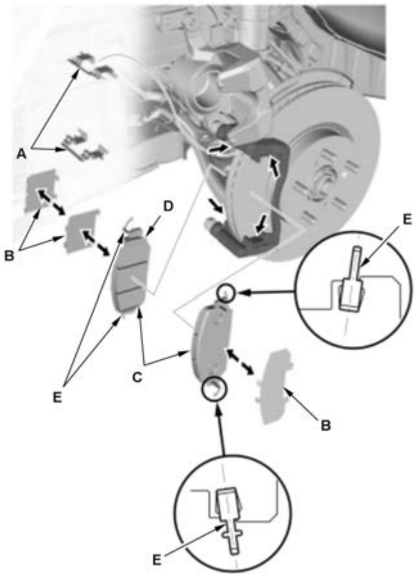
1. Brake Pad - Install



1. Install the brake caliper piston compressor tool (A) on the caliper body (B).

2. Press in the piston with the brake caliper piston compressor tool.

3. Remove the brake caliper piston compressor tool.



4. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to the retainer mating surface of the caliper bracket (indicated by the arrows).

5. Install the pad retainers (A).

NOTE:

- The upper and lower pad retainers are different. During installation, make sure the pad retainers are in the proper positions.
- If you are replacing the brake pads with new ones, also replace the pad retainers.

6. Wipe off the excess assembly paste from the retainers. Keep the assembly paste away from the brake disc and the brake pads.

7. Apply a thin coat of M-77 assembly paste (P/N 08798-9010) to the pad side of the shims (B), the back of the brake pads (C), and the other areas indicated by the arrows.

8. Wipe off the excess assembly paste from the pad shims and brake pads friction material. Keep grease and assembly paste away from the brake disc and brake pads. Contaminated brake disc or brake pads reduce stopping ability.

9. Install the brake pads and pad shims correctly with the wear indicator (D) on the upper inside position.

NOTE:

- If you are reusing the brake pads, always reinstall the brake pads in their original positions to prevent a temporary loss of braking efficiency.
- Be careful not to damage or deform the pad return springs (E). If the pad return springs is damaged or deformed, replace the brake pad as an assembly.
- The upper and lower pad return springs are different. During installation, make sure the pad return springs are

	in the proper positions.

2. Front Wheels - Install
3. Brake Fluid - Refill

1. Press the brake pedal several times to make sure the brakes work. **NOTE:** Engagement may require a greater pedal stroke immediately after the brake pads have been replaced as a set. Several applications of the brake pedal will restore the normal pedal stroke.

2. Add brake fluid as needed.

Inspection

NOTE: **Review the Service Precautions before doing repairs or service**.

1. **Vehicle - Lift**

Removal

NOTE: Review the Service Precautions before doing repairs or service.

1. Brake Fluid - Remove

1. Remove some brake fluid from the reservoir.
2. Vehicle - Lift
3. Rear Wheels - Remove
4. Brake Caliper Piston - Enter the MAINTENANCE MODE

NOTE: If the HDS is not used, remove the electric parking brake actuator, and using a T45 TORX driver, turn the spindle clockwise until it comes to a lock .

1. Connect the HDS to the data link connector (DLC)

2. Select ADJUSTMENT from ABS/VSA menu with the HDS, then enter ENTER BRAKE PAD MAINTENANCE MODE from BRAKE PAD MAINTENANCE MODE, and follow the screen prompts. Make sure TRANSITION TO PAD EXCHANGE MODE HAS BEEN COMPLETED on the screen.

3. Turn the vehicle to the OFF (LOCK) mode.

5. Brake Pad - Remove

	1. Remove the brake hose mounting bolt (A).

	2. Disconnect the connector (A). **NOTE:** If the connector lock tab is difficult to release, push in on the connector body before pushing on the release lock. 3. Remove the caliper body (B). **NOTE:** Check the hose and the pin boots for damage and deterioration.

Electric Parking Brake - Troubleshooting - Introduction - CR-V

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE ELECTRIC PARKING BRAKE SYSTEM

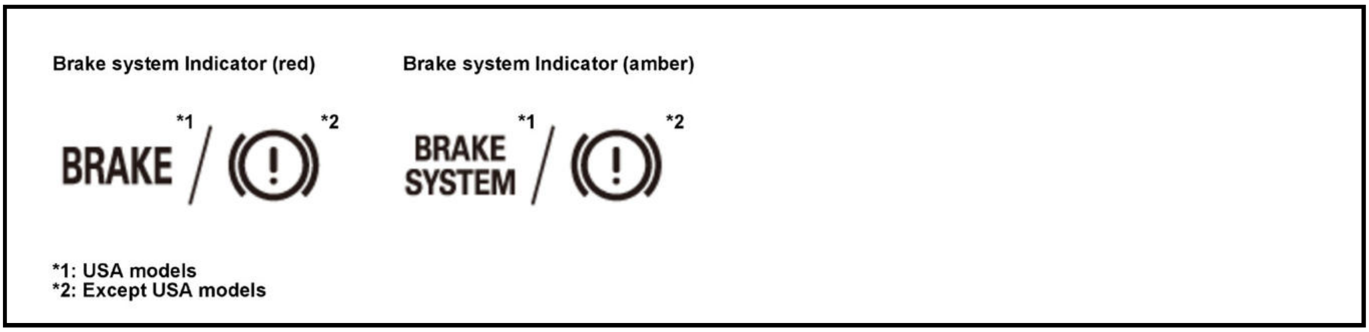
Control Unit

The vehicle is equipped with the electric parking brake and the system is controlled by the VSA modulator-control unit.

NOTE: For DTCs of the electric parking brake system, please check from the ABS/TCS/VSA menu in the HDS.

System Indicator

This system has two indicators on the gauge control module.



NOTE: For locations of each indicator, refer to gauge control module component location index .

When the system is OK, each indicator comes on for about 2 seconds after turning the vehicle to the ON mode, then it goes off. If the parking brake is applied, the brake system indicator (red) is still ON.

Brake System Indicator (Amber)

- The brake system indicator (amber) comes on when the electric parking brake function is lost.
- The brake system indicator (amber) will also illuminate when the HDS maintenance mode is enabled.

Brake System Indicator (Red)

- The brake system indicator (red) comes on when the electric parking brake is applied.
- The brake system indicator (red) blinks when the electric parking brake function is lost.

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in ascending order, not in the order they occurred.
- The DTCs are memorized in an EEPROM in the VSA modulator-control unit. Therefore, the memorized DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

- Self-diagnosis can be classified into two categories:
-

  - -

    Initial diagnosis: Done right after turning the vehicle to the ON mode and until the brake system indicator (amber) goes off.

-
  - -

    Regular diagnosis: Done right after the initial diagnosis until turning the vehicle to the OFF (LOCK) mode.

- When the system detects a problem, the VSA modulator-control unit shifts to fail-safe mode.

Electric Parking Brake Actuator

- The electric parking brake actuator operates when the parking brake applies or releases.
- The parking brake motor can be heard at the rear wheels when the parking brake is applied or released, this is normal.

Electric Parking Brake Forced Cancellation

- When the electric parking brake system has malfunction and parking brake cannot be released, you can release parking brake by doing forced cancellation procedure.
- Before doing electric parking brake forced cancellation, check for electric parking brake system DTCs with the HDS. If any DTCs are indicated, do the indicated DTC's troubleshooting and repair the cause for DTC first.
- If the electric parking brake switch fails, switch operation will be disabled and the manual release is not possible. However, depending on the malfunction, you may be able to release the parking brake by following procedures.
-
  - Buckle the driver's seat belt.
  - Start the engine.
  - Shift the transmission to D or R position/mode.
  - Slowly press the accelerator pedal.

Brake Pad Maintenance Mode

When replacing the rear brake pad, it is necessary to enter the maintenance mode with the HDS.

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the brake system indicator (amber) is still on. Following a troubleshooting procedure for a DTC that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the brake system indicator (amber) came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.

2. When the brake system indicator (amber) does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. in the circuit indicated by the DTC.

3. After troubleshooting or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the brake system indicator (amber) does not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicator(s) stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle. If it does not, **go to the F-CAN circuit troubleshooting** .

4. Check the diagnostic trouble code (DTC) for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- The HDS can read the DTC, the freeze data, the current data, and other system data.
- For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

1. With the vehicle in the OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle. If it does not, **go to the F-CAN circuit troubleshooting**

4. Follow the prompts on the HDS to display the DTC(s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in the OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle. If it does not, **go to the F-CAN circuit troubleshooting**

4. Clear the DTC(s) by following the screen prompts on the HDS.

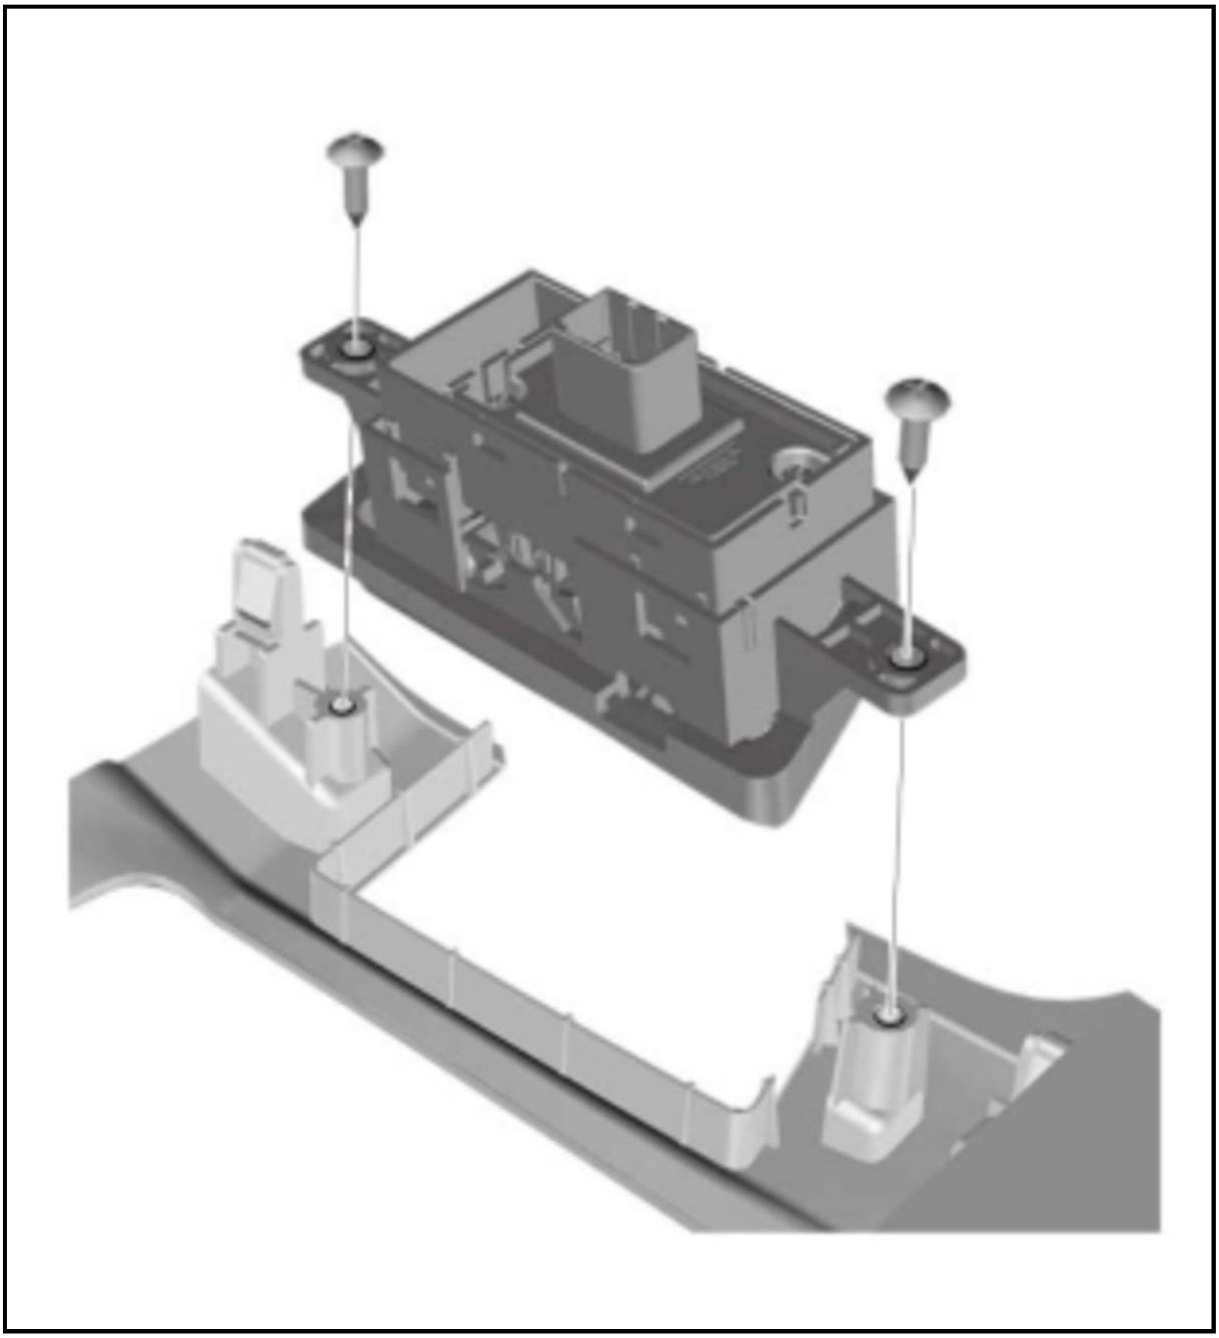
5. Turn the vehicle to the OFF (LOCK) mode.

REMOVAL & INSTALLATION TEST

ELECTRIC PARKING BRAKE SWITCH REMOVAL, INSTALLATION, AND TEST

Removal and Installation

1. Shift Lever Panel - Remove
2. Electric Parking Brake Switch - Remove



3. All Removed Parts - Install

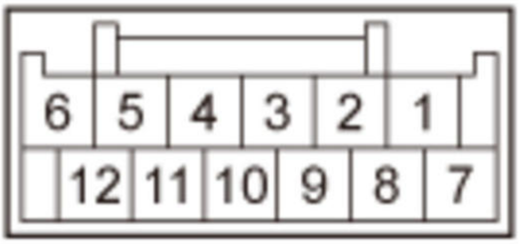
1. Install all removed parts in the reverse order of removal.

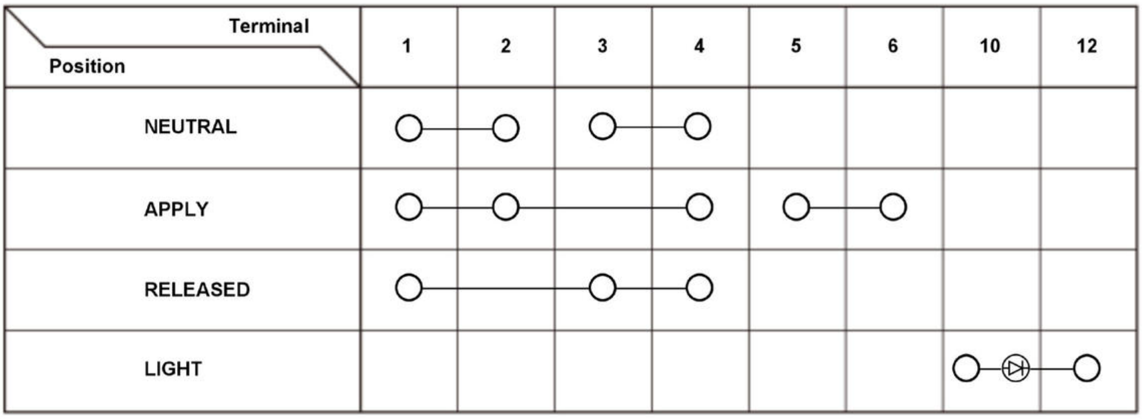
Test

1. Electric Parking Brake Switch - Test

1. On the switch side, check for continuity between the connector terminals in each switch position according to the table.

Electric parking brake/automatic brake hold switch 12P connector (male terminals)





Terminal / Position	1	2	3	4	5	6	10	12
NEUTRAL	○—	○	○—	○				
APPLY	○—	○—	—	○	○—	○		
RELEASED	○—	—	○—	○				
LIGHT							○—⊳|—	○

2. If the switch does not work as described in the table, replace the switch.

REMOVAL AND INSTALLATION

ELECTRIC PARKING BRAKE ACTUATOR REMOVAL AND INSTALLATION

Removal and Installation

NOTE: How to read the torque specifications .

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Electric Parking Brake Actuator - Remove

	1. Disconnect the connector (A). **NOTE:** **If the connector lock tab is difficult to release, push in on the connector body before pushing on the release lock.** 2. Remove the electric parking brake actuator (B). **NOTE:** **Use new mounting screws during reassembly.** 3. Remove the O-ring (C). - Replace the O-ring whenever the electric parking brake actuator is removed. - When installing the actuator, make sure there is no foreign matter on the mating surfaces and the O-ring.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

5. Electric Parking Brake Actuator After Install - Check

1. Turn the vehicle to the ON mode.

2. Apply and release the parking brake 2 times, then make sure that the brake system indicator (red) goes OFF.

NOTE:

If the brake system indicator (red) does not go OFF, check for a poor connection at the electric

parking brake actuator connector. 3. Turn the vehicle to the OFF (LOCK) mode.

DESCRIPTION & OPERATION

ELECTRIC PARKING BRAKE SYSTEM DESCRIPTION

Overview

The electric parking brake system replaces the traditional parking brake pedal or lever and linkage with an electrically controlled parking brake mechanism in the rear calipers. This reduces driver effort and provides additional features such as:

- Simple electric switch operation
- Parking brake release upon acceleration
- Automatic rollaway prevention

The system is controlled by the VSA modulator-control unit.

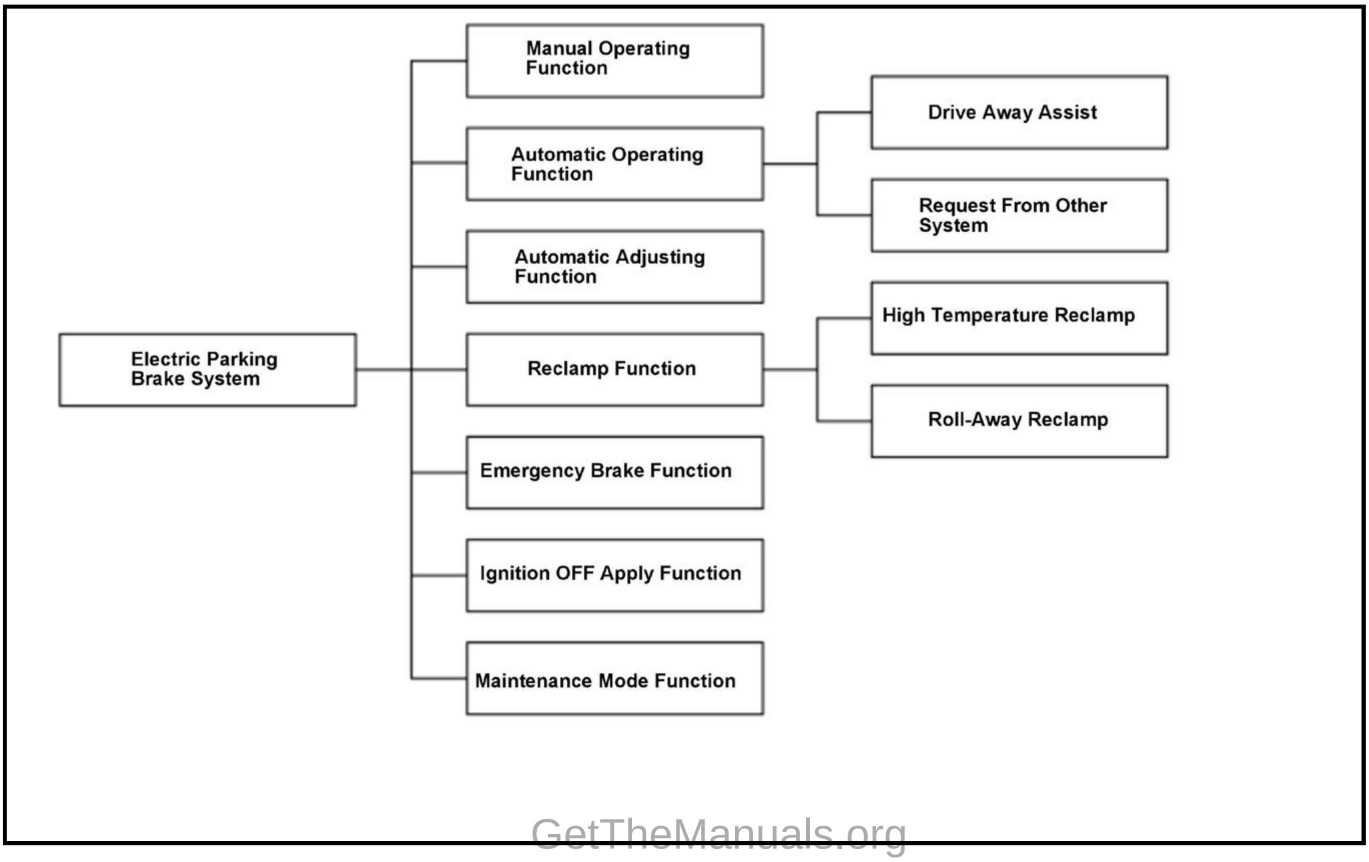
The electric parking brake system consists of the following primary components:

- VSA modulator-control unit
- Electric parking brake actuators
- Electric parking brake switch
- System indicator

For locations of each component on the vehicle, refer to Component Location Index, and for functions of the indicator, refer to How to Troubleshoot the Electric Parking Brake .

Function

The electric parking brake system has following functions.



Electric Parking Brake System
Manual Operating Function
Automatic Operating Function
Automatic Adjusting Function
Reclamp Function
Emergency Brake Function
Ignition OFF Apply Function
Maintenance Mode Function
Drive Away Assist
Request From Other System
High Temperature Reclamp
Roll-Away Reclamp

Manual Operating Function

The electric parking brake can be manually applied and released using the switch. Pulling up on the electric parking brake switch applies the parking brake. Firmly applying the brake pedal and pushing down on the electric parking brake switch releases it.

Automatic Operating Function - Drive Away Assist

When using the automatic brake hold function, the electric parking brake is released automatically when the vehicle is driven away from a stop with the driver's seat belt buckled. Problems in the electric parking brake switch circuits do not affect automatic apply and release.

Automatic Operating Function - Request From Other System

While the electric brake booster system is preventing vehicle movement during automatic brake hold control, the electric parking brake system may operate automatically. This will occur after a specific time period has elapsed based on commands sent from the electric brake booster.

Automatic Adjusting Function

Because the parking brake is automatically adjusted whenever applying the parking brake, the electric parking brake needs no adjustment. And, if the vehicle is driven 625 miles (1, 000 km) without applying the parking brake, the parking brake is automatically applied and released while vehicle is at a short stop, and adjusts the remaining brake pads.

Reclamp Function - High Temperature Reclamp

Brake disc temperature is calculated from the vehicle's kinetic energy as it stops, because loss of clamping force can occur when brake system components contract as they cool. If the calculated brake temperature exceeds a predetermined threshold, the high temperature reclamp function reapplies the electric parking brake actuators after a cool-down time has elapsed to compensate for any loss of clamping force. In order to accommodate this function, the VSA modulator-control unit may be kept on for a period of time after the turning the vehicle to the OFF (LOCK) mode. Depending on when high temperature reclamp occurs, the driver may notice the motor noise.

Reclamp Function - Roll-Away Reclamp

The roll-away reclamp function reapplies the parking brake if wheel movement is detected after the electric parking brake is applied.

Emergency Brake Function

In an emergency situation, such as a failure of the conventional brake system, the electric parking brake system performs the emergency brake function by activating the electric parking brake switch continuously. There are two controls depending on the state of the VSA system.

In cases where the VSA system can perform the pressure adding control:

The electric parking brake system sends the brake control request to the VSA system which applies the emergency brake using the pressure adding control.

In cases where the VSA system can not perform the pressure adding control:

The electric parking brake system controls the electric parking brake actuator so that the wheels do not lock, and applies the emergency brake instead of the VSA system. However, if the wheel speed signal is abnormal, the anti-lock control is not perform.

Ignition OFF Apply Function

The electric parking brake system can apply the parking brake automatically when the vehicle is turned to the OFF (LOCK) mode based on customer preferences. It may be necessary to temporarily cancel this function in certain service procedures. **Refer to How To Temporarily Cancel Automatic Electric Parking Brake**. For more information on how to turn on or off the automatic parking brake function, refer to the owner's manual.

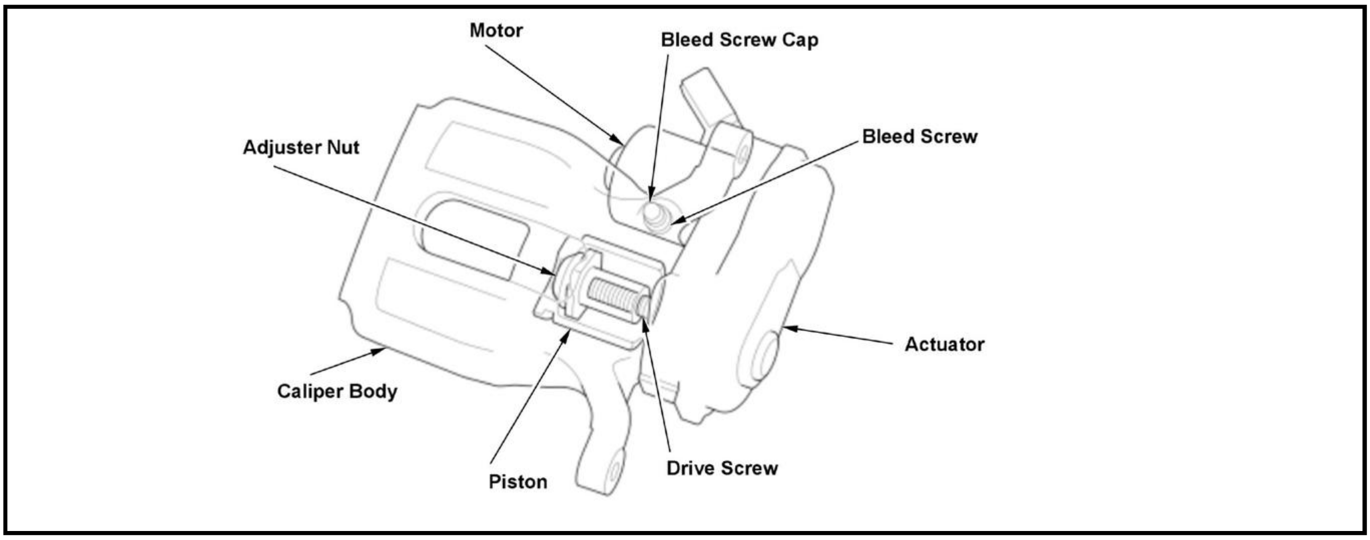
Maintenance Mode

The electric parking brake system has a brake pad maintenance mode functional test. This test fully releases the parking brake mechanism so that brake service, such as rear pad replacement, can be done. Maintenance mode can be activated by the HDS.

ELECTRIC PARKING BRAKE SYSTEM DESCRIPTION - COMPONENTS

Electric Parking Brake Actuator

The electric parking brake actuator has a built-in DC motor. When the motor operates, the motor's speed is reduced by the drive screw mechanism, increasing torque. The spindle and the nut inside the caliper piston force it outward to generate brake pad clamping force. The electric parking brake actuators are automatically adjusted to compensate for brake pad wear, so no parking brake adjustment is necessary.



When the electric parking brake system has a malfunction and the parking brake cannot be released, you can release the parking brake by doing the forced cancellation procedure. **Refer to the forced cancellation procedure**.

Electric Parking Brake Switch

The electric parking brake switch is connected to the VSA modulator-control unit using four separate circuits. The control unit must see the correct voltage patterns on all 4 circuits, or the switch will be disabled and a DTC will be set.

RESET PROCEDURE

ELECTRIC PARKING BRAKE SYSTEM FORCED CANCELLATION

Procedure

NOTE: Forced cancellation is performed when the system is abnormal and the parking brake cannot be released.

1. Vehicle - Lift
2. Rear Wheel - Remove
3. Electric Parking Brake Actuator - Remove
4. Parking Brake - Forced Cancel

	1. Using a TORX driver, turn the spindle shaft (A) clockwise until parking brake is released.

GENERAL INFORMATION

HOW TO TEMPORARILY CANCEL AUTOMATIC ELECTRIC PARKING BRAKE

Procedure

NOTE:

- The electric parking brake on this vehicle has the ability to apply itself once the vehicle is turned to the OFF (LOCK) mode based on the customer's preferences. During certain service procedures, it may be necessary to turn off this function temporarily.
- Refer to the owner's manual for more information on how to turn on or off the automatic parking brake function.

For more information, **refer to the Electric Parking Brake System Description**.

1. Temporary Cancellation

> **NOTE:** Before doing this procedure, turn off the ACC function (if equipped) and the automatic brake hold function.
>
> 1. Park the vehicle with the vehicle in the ON mode.
>
> 2. Turn the vehicle to the OFF (LOCK) mode, then within 2 seconds pull up the electric parking brake switch.

SYMPTOM TROUBLESHOOTING

ELECTRIC PARKING BRAKE SYSTEM SYMPTOM TROUBLESHOOTING - BRAKE SYSTEM INDICATOR (RED) INDICATOR DOES NOT COME ON

Brake system indicator (red) indicator does not come on

1. Gauge control module operation check

   -1. Do the gauge control module self-diagnostic function .

   Is the gauge control module OK?

   YES

   Go to step 2.

   NO

   Replace the gauge control module .

2. Open wire check (PARK LAMP line)

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Gauge control module connector A (32P)

   -3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
	VSA modulator-control unit 46P connector: disconnected

	Gauge control module connector A (32P): disconnected
Test point 1	**VSA modulator-control unit 46P connector No. 29**
Test point 2	**Gauge control module connector A (32P) No. 10**

Is there continuity?

YES

The PARK LAMP wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the VSA modulator-control unit** .

NO

Repair an open in the wire between the VSA modulator-control unit and the gauge control module.

ELECTRIC PARKING BRAKE SYSTEM SYMPTOM TROUBLESHOOTING - BRAKE SYSTEM INDICATOR (RED) INDICATOR DOES NOT GO OFF

Brake system indicator (red) indicator does not go off

1. DTC check

-1. Turn the vehicle to the ON mode.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame

Is DTC indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 2.

2. Gauge control module operation check

-1. **Do the gauge control module self-diagnostic function** .

Is the gauge control module OK?

YES

Go to step 3.

NO

Replace the gauge control module .

3. Shorted wire check (PARK LAMP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

VSA modulator-control unit 46P connector
Gauge control module connector A (32P)

-3. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

	Gauge control module connector A (32P): disconnected
Test point 1	VSA modulator-control unit 46P connector No. 29
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire between the VSA modulator-control unit and the gauge control module.

NO

The PARK LAMP wire is OK. Check for loose terminals and poor connections in the VSA modulator-control unit 46P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the VSA modulator-control unit .

ADVANCED DIAGNOSTICS

DTC B0050-F0 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC B0050-F0: (Driver's Seat Belt Buckle Switch Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop automatic brake hold function (Re-diagnose at the next IG-ON)
Possible Cause	• Driver's seat belt buckle assembly internal failure (Driver's seat belt buckle switch)

DTC C0023-12

DTC C0023-12: Brake Diag Circuit ON Failure

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on
Fail Safe Action	- Stop automatic brake hold function (Re-diagnose at the next IG-ON)
Possible Cause	- SRS unit internal failure (Yaw rate sensor)

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode. - Press the brake pedal hard.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle

	- Brake system indicator (amber) on
Fail Safe Action	- None
Possible Cause	- Pedal feel simulator internal failure (Piston cup) - Brake fluid leakage

DTC P1E44-00: Electric Servo Brake Control Unit Internal Circuit Malfunction (Charge Pump Circuit)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on
Fail Safe Action	• Stop electric servo brake function (Re-diagnose at the next IG-ON) • Stop brake assist function (Re-diagnose at the next IG-ON) • Stop automatic brake hold function (Re-diagnose at the next IG-ON) • Stop hill start assist function (Re-diagnose at the next IG-ON) • Stop deceleration assist brake cooperative control function (Re-diagnose at the next IG-ON) • Stop VSA assist cooperative control function (Re-diagnose at the next IG-ON) • Stop stall management function (Re-diagnose at the next IG-ON) • Stop regenerative brake function (Re-diagnose at the next IG-ON) • Stop driving support system brake control function (Re-diagnose at the next IG-ON)
Possible Cause	• Electric servo brake control unit internal failure

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 2 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop brake assist function (Re-diagnose at the next IG-ON) • Stop automatic brake hold function (Re-diagnose at the next IG-ON) • Stop hill start assist function (Re-diagnose at the next IG-ON) • Stop deceleration assist brake cooperative control function (Re-diagnose at the next IG-ON) • Stop VSA assist cooperative control function (Re-diagnose at the next IG-ON) • Stop stall management function (Re-diagnose at the next IG-ON) • Stop regenerative brake function (Re-diagnose at the next IG-ON) • Stop driving support system brake control function (Re-diagnose at the next IG-ON)
Possible Cause	• Open, short to ground, short to another wire, or poor connection between the electric servo brake control unit and other control units (F-CAN lines) • Internal failure of other unit on F-CAN • Electric servo brake control unit internal failure

DTC U0100-00 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U0100-00: F-CAN Malfunction (Electric Servo Brake Control Unit Lost Communication With Management ECU)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on
Fail Safe Action	- Stop automatic brake hold function (Re-diagnose at the next IG-ON)
Possible Cause	- Open, short to ground, short to another wire, or poor connection between the electric servo brake control unit and the gauge control module (F-CAN lines) - Gauge control module internal failure

	- Electric servo brake control unit internal failure

DTC U0401-68 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U0401-68: (PGM-FI/ECM/PCM System Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop automatic brake hold function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop hill start assist function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop stall management function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop regenerative brake function (Dependant upon the conditions) Re-diagnose at the next IG-ON)
Possible Cause	• PGM-FI system failure • PCM internal failure

DTC U0415-68 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U0415-68: (ABS System Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop brake assist function (Re-diagnose at the next IG-ON) • Stop automatic brake hold function (Re-diagnose at the next IG-ON) • Stop hill start assist function (Re-diagnose at the next IG-ON) • Stop regenerative brake function (Re-diagnose at the next IG-ON) • Stop driving support system brake control function (Re-diagnose at the next IG-ON)
Possible Cause	• VSA system failure • VSA modulator-control unit internal failure

DTC U0416-68 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U0416-68: (VSA System Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop brake assist function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop automatic brake hold function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop hill start assist function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop VSA assist cooperative control function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop stall management function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop regenerative brake function (Dependant upon the conditions) Re-diagnose at the next IG-ON) • Stop driving support system brake control function (Dependant upon the conditions) Re-diagnose at the next IG-ON)
Possible Cause	• VSA system failure • VSA modulator-control unit internal failure

DTC U0417-68 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U0417-68: (Electric Parking Brake System Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop automatic brake hold function (Re-diagnose at the next IG-ON) • Stop deceleration assist brake cooperative control function (Re-diagnose at the next IG-ON)
Possible Cause	• Electric parking brake system failure • VSA modulator-control unit internal failure

DTC U3000-49 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U3000-49: Driver's Door Switch Signal Stuck On (ECU Internal Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	- 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: - Turn the vehicle to the ON mode. - Open and close the driver's door. - Wait 2 minutes or more.
Execution	Regular Diagnosis
Duration	About 2 minutes
DTC Type	- 1 drive cycle - Brake system indicator (amber) on
Fail Safe Action	- None
Possible Cause	- Electric servo brake control unit internal failure

DTC U3003-16 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U3003-16: Electric Servo Brake Control Unit Power Source Circuit (+B) Low Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode. - Wait 10 seconds or more.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 10 seconds
DTC Type	- 1 drive cycle - Brake system indicator (red) on - Brake system indicator (amber) on
Fail Safe Action	- Stop electric servo brake function (Re-diagnose at the next IG-ON) - Stop brake assist function (Re-diagnose at the next IG-ON)

	• Stop automatic brake hold function (Re-diagnose at the next IG-ON) • Stop hill start assist function (Re-diagnose at the next IG-ON) • Stop deceleration assist brake cooperative control function (Re-diagnose at the next IG-ON) • Stop VSA assist cooperative control function (Re-diagnose at the next IG-ON) • Stop stall management function (Re-diagnose at the next IG-ON) • Stop regenerative brake function (Re-diagnose at the next IG-ON) • Stop driving support system brake control function (Re-diagnose at the next IG-ON)
Possible Cause	• Open or short to ground between the under-hood fuse/relay box and the electric servo brake control unit (+B_ESB line) • Blown fuse (No. A1-2) • Abnormal 12 volt battery • Electric powertrain system failure • Electric servo brake control unit internal failure

DTC U3003-17 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U3003-17: Electric Servo Brake Control Unit Power Source Circuit (+B) High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Wait 10 seconds or more.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 10 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on
Fail Safe Action	• Stop electric servo brake function (Re-diagnose at the next IG-ON)

	- Stop brake assist function (Re-diagnose at the next IG-ON) - Stop automatic brake hold function (Re-diagnose at the next IG-ON) - Stop hill start assist function (Re-diagnose at the next IG-ON) - Stop deceleration assist brake cooperative control function (Re-diagnose at the next IG-ON) - Stop VSA assist cooperative control function (Re-diagnose at the next IG-ON) - Stop stall management function (Re-diagnose at the next IG-ON) - Stop regenerative brake function (Re-diagnose at the next IG-ON) - Stop driving support system brake control function (Re-diagnose at the next IG-ON)
Possible Cause	- Abnormal 12 volt battery - Electric powertrain system failure - Electric servo brake control unit internal failure

DTC U3003-92 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U3003-92 : System Voltage Low (Long Term)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the brake system indicator (red or amber) comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the brake system indicator (red or amber) goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to Troubleshoot the Electric Servo Brake System" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 9.5 - 16.7 V With the Driving Pattern: - Turn the vehicle to the ON mode. - Wait 60 seconds or more.
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	- 1 drive cycle - Brake system indicator (red) on - Brake system indicator (amber) on

Fail Safe Action	• None
Possible Cause	• Electric powertrain system failure • Electric servo brake control unit internal failure

DTC TROUBLESHOOTING

DTC B0050-F0 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC B0050-F0 : (Driver's Seat Belt Buckle Switch Malfunction)

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
B0050-F0 (Driver's Seat Belt Buckle Switch Malfunction)	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B0050-F0 (Driver's Seat Belt Buckle Switch Malfunction)	B	B

   Is DTC B0050-F0 indicated?

   YES

   The failure is duplicated. Go to SRS troubleshooting .

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C0023-12

DTC C0023-12 : Brake Diag Circuit ON Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C0023-12 Brake Diag Circuit ON Failure	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait 1 second or more without pressing the brake pedal

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-12 Brake Diag Circuit ON Failure	B	B

Is DTC C0023-12 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Brake light relay check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Replace the relay circuit board .

NO

Go to step 3.

3. Shorted wire check (BRK_LAMP line) 1

-1. Turn the vehicle to the ON mode.

-2. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Go to step 4.

NO

The BRK_LAMP wire is OK. Go to step 5.

4. Shorted wire check (BRK_LAMP line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric servo brake control unit 22P connector

-3. Turn the vehicle to the ON mode.

-4. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

Repair a short to body ground in the wire between the electric servo brake control unit and the relay circuit board.

NO

The BRK_LAMP wire is OK. Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

5. Open wire check (STOP_SW line)

-1. Turn the vehicle to the OFF (LOCK) mode.

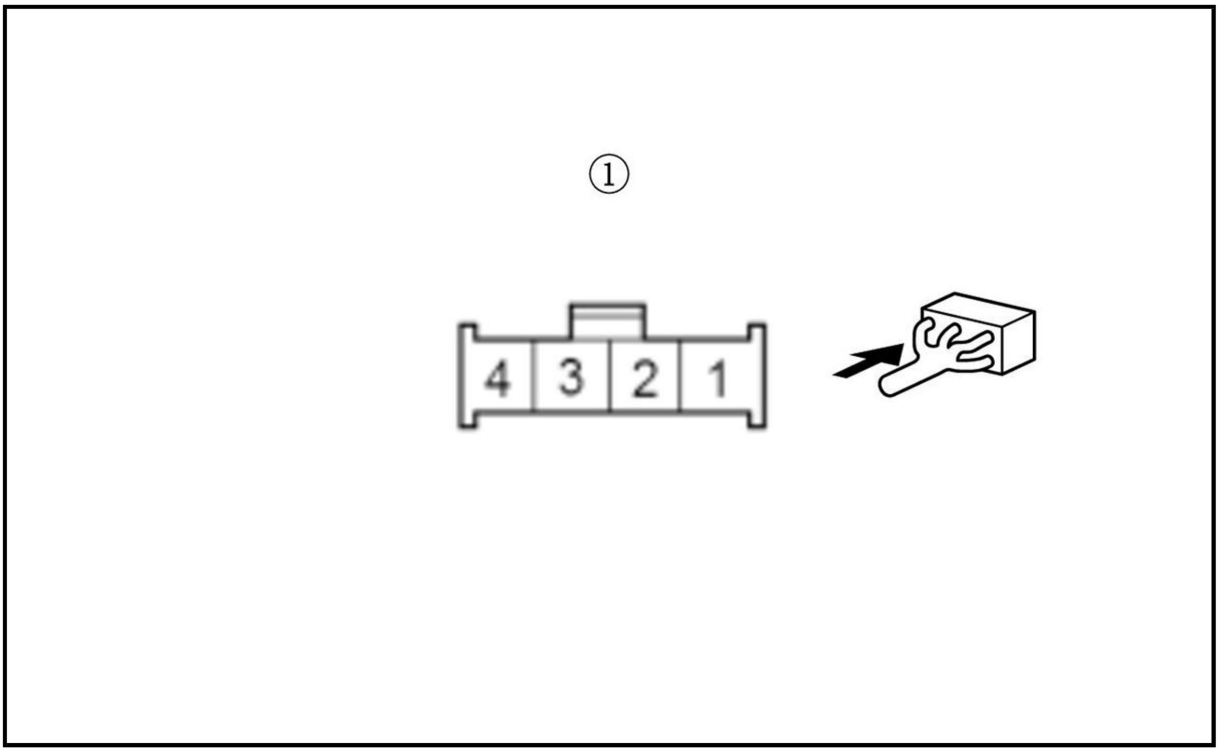
-2. Jump the SCS line with the HDS, and wait more than 1 minute.

-3. Disconnect the following connectors.

Brake pedal position switch 4P connector
PCM connector A (50P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal position switch 4P connector: disconnected
B	PCM connector A (50P): disconnected
Test point 1	Brake pedal position switch 4P connector (female terminals) No. 1: ①
Test point 2	**PCM connector A (50P) No. 26**



Is there 1.0 Ω or less?

YES

The STOP_SW wire is OK. Go to step 6.

NO

Repair an open in the wire between the PCM and the brake pedal position switch.

6. PCM check

-1. **Substitute a known-good PCM** .

-2. Reconnect the following connectors.

PCM connector A (50P)
Brake pedal position switch 4P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTC with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Wait 1 second or more without pressing the brake pedal.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-12 Brake Diag Circuit ON Failure	B	B

Is DTC C0023-12 indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting.

If they are OK, replace the electric servo brake control unit/pedal feel simulator .

NO

Replace the original PCM .

DTC C0023-14

DTC C0023-14 : Brake Diag Circuit OFF Failure

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C0023-14 Brake Diag Circuit OFF Failure	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Do the BRAKE LIGHT RELAY function test with the HDS.

   BRAKE LIGHT RELAY TEST

   Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0023-14 Brake Diag Circuit OFF Failure	B	B

   Is DTC C0023-14 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Brake light relay check

   -1. Check the relay circuit board .

   Is the relay circuit board OK?

   YES

   Go to step 3.

   NO

   Replace the relay circuit board .

3. Open wire check (BRK_LAMP line) 1

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Electric servo brake control unit 22P connector

-3. Connect terminals 1 and 2 with a jumper wire.

Terminal 1	**Electric servo brake control unit 22P connector No. 13**
Terminal 2	Body ground

-4. Turn the vehicle to the ON mode.

-5. Check the brake lights without pressing the brake pedal.

Are the brake lights on?

YES

The BRK_LAMP wire is OK. Go to step 7.

NO

Go to step 4.

4. Open wire check (BRK_LAMP line) 2

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire.

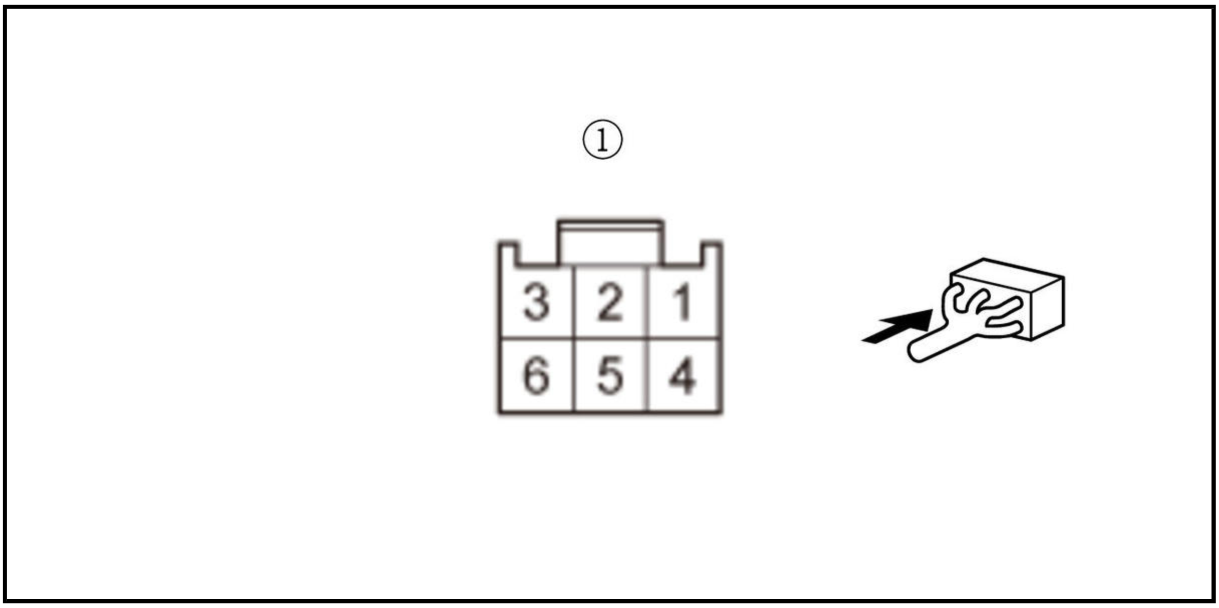
-3. Disconnect the following connector.

Relay circuit board connector B (6P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

B	Relay circuit board connector B (6P): disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	**Electric servo brake control unit 22P connector No. 13**
Test point 2	Relay circuit board connector B (6P) (female terminals) No. 1: ①



Is there 1.0 Ω or less?

YES

The BRK_LAMP wire is OK. Go to step 5.

NO

Repair an open in the wire between the electric servo brake control unit and the relay circuit board.

5. Open wire check (IG1_OPTION line)

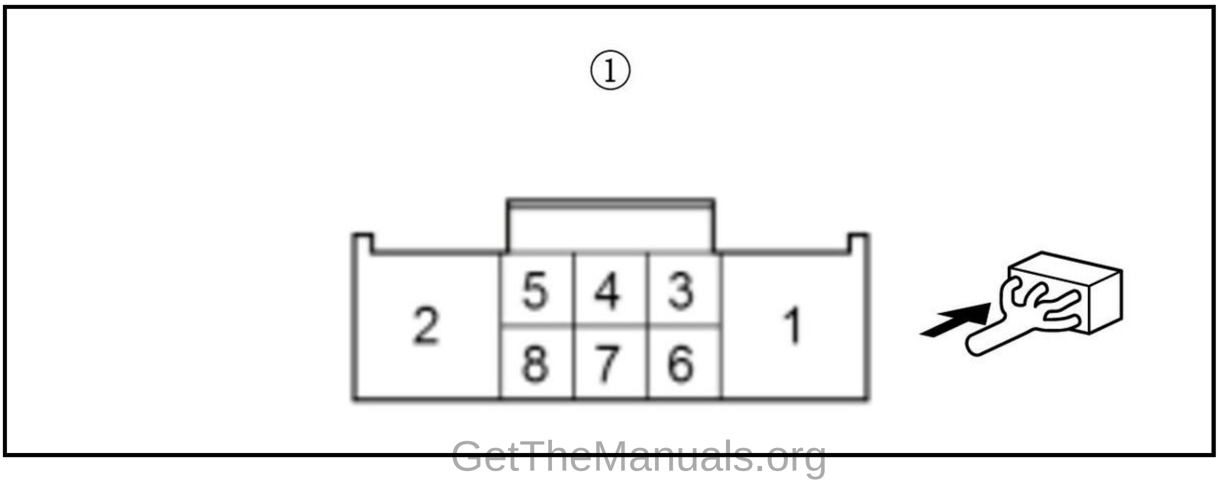
-1. Disconnect the following connector.

Relay circuit board connector A (8P)

-2. Turn the vehicle to the ON mode.

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Relay circuit board connector A (8P): disconnected
B	Relay circuit board connector B (6P): disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	Relay circuit board connector A (8P) (female terminals) No. 3: ①
Test point 2	Body ground



Is there battery voltage?

YES

The IG1_OPTION wire is OK. Go to step 6.

NO

Repair an open in the wire between the relay circuit board and the **No. D5** fuse.

6. Open wire check (+B_STOP line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Relay circuit board connector C (18P)

-3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

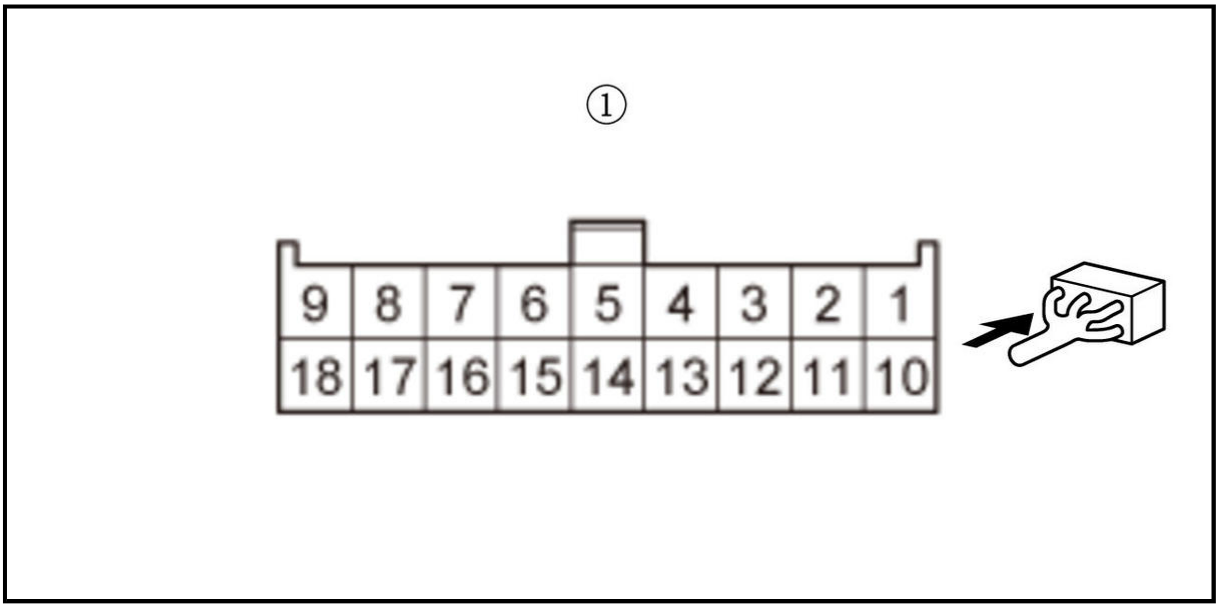
Test point 2	Body ground



Is there battery voltage?

YES

The +B_STOP wire is OK. Go to step 7.

NO

Repair an open in the wire between the relay circuit board and the **No. A9** fuse.

7. Open wire check (BRK_DIAG line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the jumper wire. (if connected)

-3. Disconnect the following connector. (if connected)

Relay circuit board connector A (8P)

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

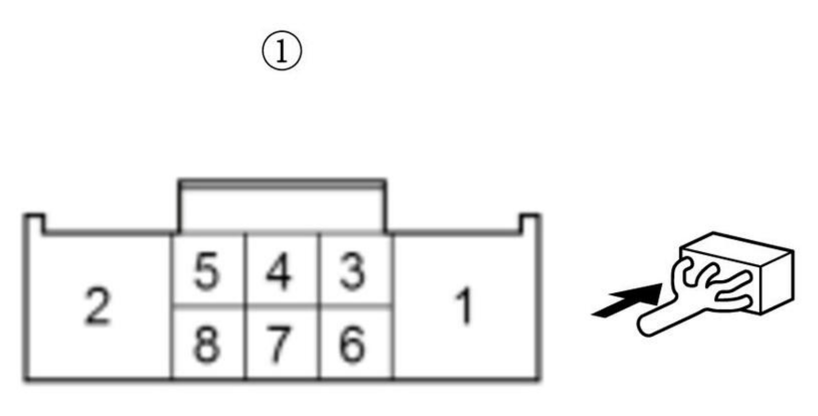
Test point 1	**Electric servo brake control unit 22P connector No. 16**
Test point 2	Relay circuit board connector A (8P) (female terminals) No. 6: ①



Is there 1.0 Ω or less?

YES

The BRK_DIAG wire is OK. Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the wire between the electric servo brake control unit and the relay circuit board.

DTC C0049-7A

DTC C0049-7A : Brake Fluid Leak or Seal Failure

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- The DTCs may be indicated under these conditions:
-
    - -

Bleed the brake system .

- -

  Replace the brake fluid .

- -

  Air trapped in the brake system.

DTC Description	DTC	Freeze Frame
C0049-7A Brake Fluid Leak or Seal Failure	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Test-drive the vehicle and stop the vehicle by pressing the brake pedal. Repeat this procedure in the 1 drive cycle at least 5 times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0049-7A Brake Fluid Leak or Seal Failure	B	B

   Is DTC C0049-7A indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Brake fluid leakage check

   -1. Press the brake pedal hard and hold for several seconds.

   -2. **Inspect the brake system** .

   Is there a fluid leakΩ

   YES

   Repair the brake fluid leak.

   NO

   Go to step 3.

3. Slave cylinder check

-1. Bleed the brake system .

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-4. Test-drive the vehicle and stop the vehicle by pressing the brake pedal. Repeat this procedure in the 1 drive cycle at least 5 times.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0049-7A Brake Fluid Leak or Seal Failure	B	B

Is DTC C0049-7A indicated?

YES

Replace the slave cylinder .

NO

Troubleshooting is complete.

DTC C0062-F0, C0063-F0 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC C0062-F0 : Longitudinal Acceleration Sensor Malfunction

DTC C0063-F0 : Yaw Rate Sensor Malfunction

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
C0062-F0 Longitudinal Acceleration Sensor Malfunction	B	B
C0063-F0 Yaw Rate Sensor Malfunction	B	B

DTC (Electric servo brake)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C0062-F0 Longitudinal Acceleration Sensor Malfunction	B	B
C0063-F0 Yaw Rate Sensor Malfunction	B	B

Is DTC C0062-F0 or C0063-F0 indicated?

YES

The failure is duplicated. Replace the SRS unit .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC C1260-7A

DTC C1260-7A : Brake Fluid Leak or Seal Failure in Pedal Feel Simulator

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- The DTCs may be indicated under these conditions:
-
  - -

    Bleed the brake system .
  - -

    Replace the brake fluid .
  - -

    Air trapped in the brake system.

DTC Description	DTC	Freeze Frame
C1260-7A Brake Fluid Leak or Seal Failure in Pedal Feel Simulator	B	B

DTC (Electric servo brake)

1. Problem verification 1

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

   -4. Press the brake pedal hard.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1260-7A Brake Fluid Leak or Seal Failure in Pedal Feel Simulator	B	B

   Is DTC C1260-7A indicated?

   YES

   The failure is duplicated. Go to step 3.

   NO

   Go to step 2.

2. Problem verification 2

-1. Press the brake pedal slowly and fully, then hold it.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1260-7A Brake Fluid Leak or Seal Failure in Pedal Feel Simulator	B	B

Is DTC C1260-7A indicated?

YES

The failure is duplicated. Go to step 3.

NO

Intermittent failure, the system is OK at this time . **Check for brake fluid leakage at the pedal feel simulator and the VSA modulator-control unit, tandem motor cylinder, hose and line joints** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Pedal feel simulator check

-1. **Bleed the brake system** .

-2. Turn the vehicle to the ON mode.

-3. Clear the DTC with the HDS.

-4. Turn the vehicle to the OFF (LOCK) mode, then to the READY TO DRIVE mode.

-5. Press the brake pedal hard.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1260-7A Brake Fluid Leak or Seal Failure in Pedal Feel Simulator	B	B

Is DTC C1260-7A indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Go to step 4.

4. DTC check

-1. Press the brake pedal slowly and fully, then hold it.

-2. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame

Is DTC C1260-7A indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Troubleshooting is complete.

DTC C1270-11

DTC C1270-11 : Automatic Brake Hold Switch Signal Circuit Short

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1270-11 Automatic Brake Hold Switch Signal Circuit Short	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1270-11 Automatic Brake Hold Switch Signal Circuit Short	B	B

Is DTC C1270-11 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Automatic brake hold switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check the automatic brake hold switch** .

   Is the automatic brake hold switch OK?

YES

Go to step 3.

NO

Replace the electric parking brake/automatic brake hold switch .

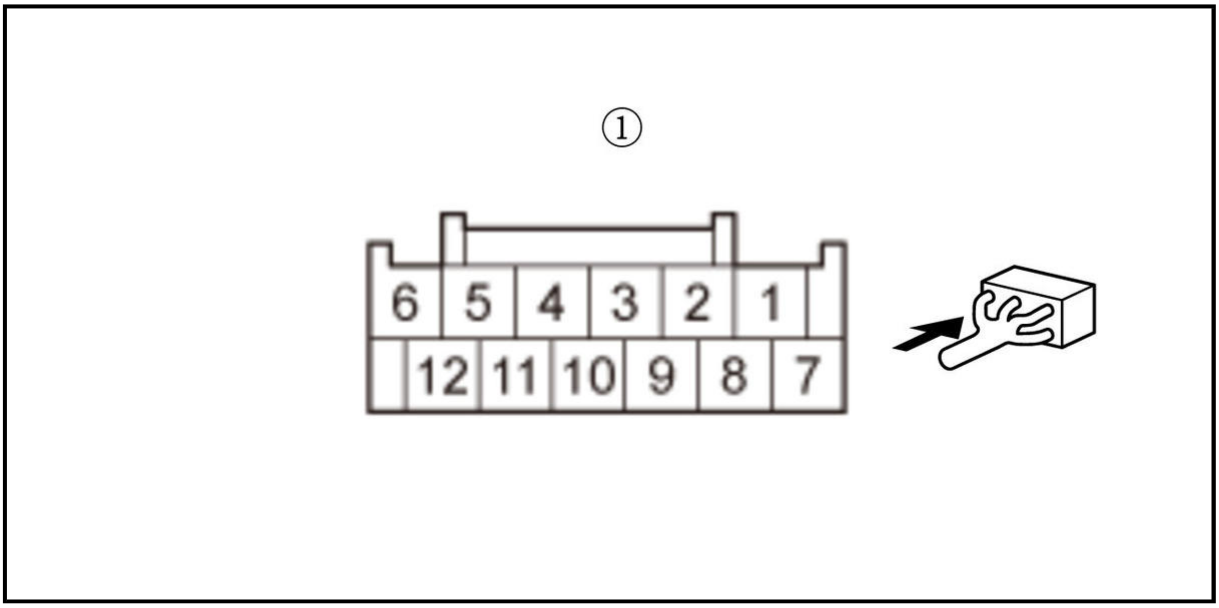
3. Shorted wire check (BRAKE_HOLD line)

-1. Disconnect the following connectors.

Electric parking brake/automatic brake hold switch 12P connector
Gauge control module connector A (32P)

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

Replace the gauge control module .

NO

Repair a short to body ground in the wire between the electric parking brake/automatic brake hold switch and the gauge control module.

DTC C1270-15

DTC C1270-15 : Automatic Brake Hold Switch Signal Circuit Open

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
C1270-15 Automatic Brake Hold Switch Signal Circuit Open	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1270-15 Automatic Brake Hold Switch Signal Circuit Open	B	B

   Is DTC C1270-15 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Automatic brake hold switch check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. **Check the automatic brake hold switch** .

   Is the automatic brake hold switch OK?

   YES

   Go to step 3.

   NO

   Replace the electric parking brake/automatic brake hold switch .

3. Open wire check (BRAKE_HOLD line) 1

   -1. Disconnect the following connector.

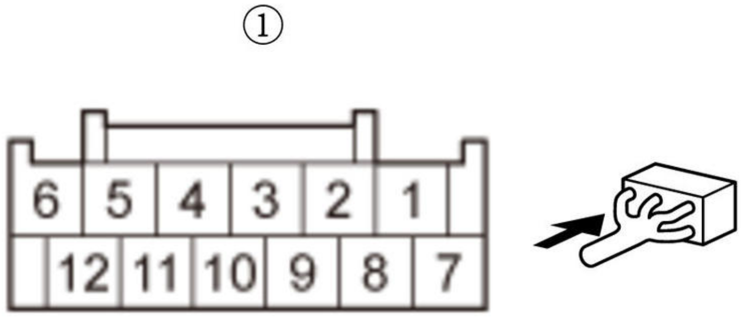
Electric parking brake/automatic brake hold switch 12P connector

   -2. Turn the vehicle to the ON mode.

   -3. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected

Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there about 5 V?

YES

The BRAKE_HOLD wire is OK. Go to step 4.

NO

Go to step 5.

NO

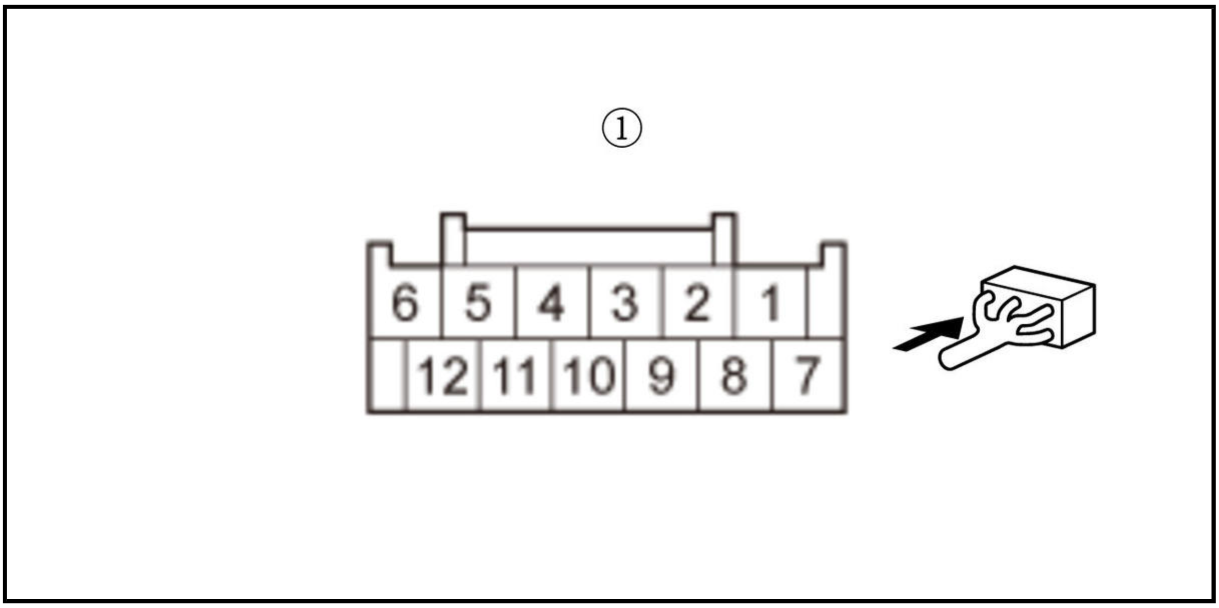
Go to step 6.

4. Open wire check (GND line)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector No. 8 (female terminals): ①
Test point 2	Body ground



Is there 1.0 Ω or less?

YES

The GND wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the electric parking brake/automatic brake hold switch and body ground (G402).

5. Shorted wire check (BRAKE_HOLD line to power)

-1. Turn the vehicle to the OFF (LOCK) mode.

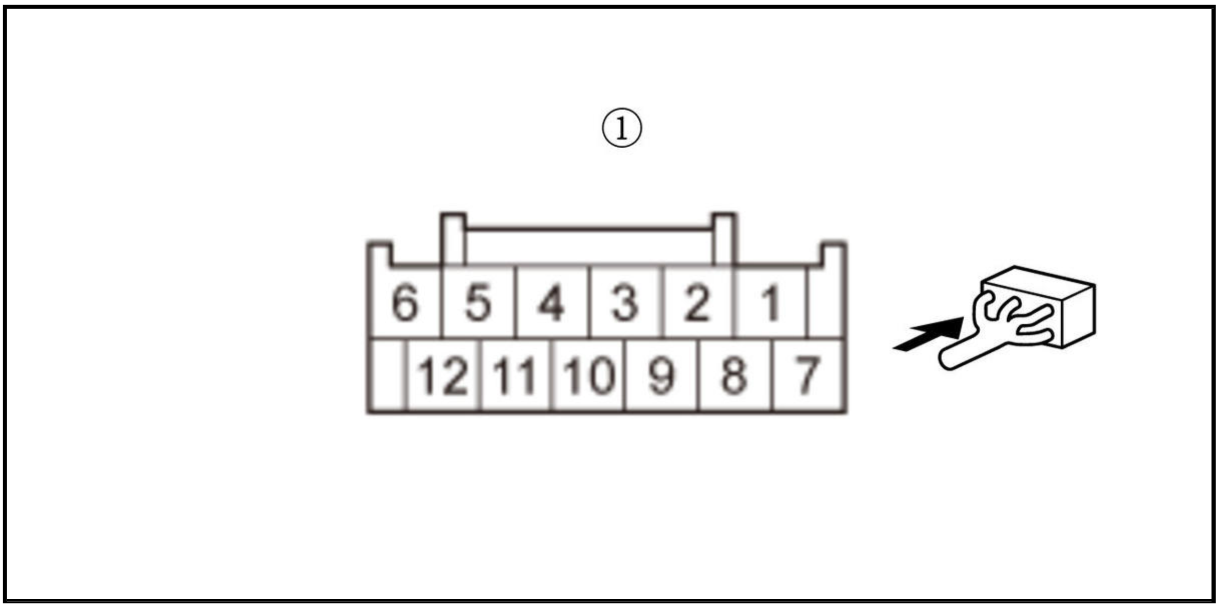
-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Turn the vehicle to the ON mode.

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	Body ground



Is there 0.1 V or more?

YES

Repair a short to power in the wire between the automatic brake hold switch and the gauge control module.

NO

The BRAKE_HOLD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

6. Open wire check (BRAKE_HOLD line) 2

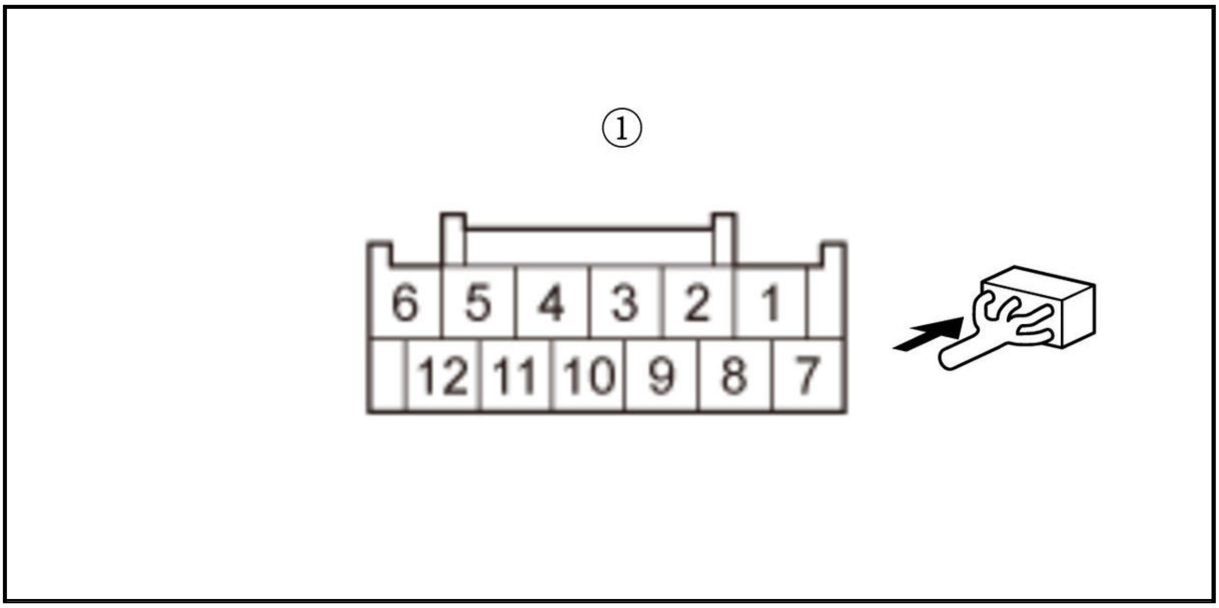
-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connector.

Gauge control module connector A (32P)

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric parking brake/automatic brake hold switch 12P connector: disconnected
B	Gauge control module connector A (32P): disconnected
Test point 1	Electric parking brake/automatic brake hold switch 12P connector (female terminals) No. 7: ①
Test point 2	**Gauge control module connector A (32P) No. 12**



Is there 1.0 Ω or less?

YES

The BRAKE_HOLD wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

NO

Repair an open in the wire between the electric parking brake/automatic brake hold switch and the gauge control module.

DTC P057B-00

DTC P057B-00 : Brake Pedal Stroke Sensor Circuit Range/Performance Problem

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P057B-00 Brake Pedal Stroke Sensor Circuit Range/Performance Problem	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Press the brake pedal several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P057B-00 Brake Pedal Stroke Sensor Circuit Range/Performance Problem	B	B

Is DTC P057B-00 indicated?

YES

The failure is duplicated. Go to step 3.

NO

Go to step 2.

2. Brake pedal stroke sensor check

-1. Check the parameter(s) below with the HDS without pressing the brake pedal.

Signal	Threshold		Current conditions	
	Value	**Unit**	**Value**	**Unit**
Brake Pedal Stroke Sensor Voltage	Less than 0.96	V	B	B
Brake Pedal Stroke Redundant Sensor Voltage	More than 4.04	V	B	B

Do the current conditions match the threshold?

YES

Go to step 3.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

3. Brake pedal stroke sensor installation check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Check the brake pedal stroke sensor and its connector for damage and proper installation.

Is the brake pedal stroke sensor installation OK?

YES

Replace the brake pedal .

NO

Reinstall the brake pedal, and check the mounting position .

DTC P057C-00, P1E25-00

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (ESB_SVCC line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

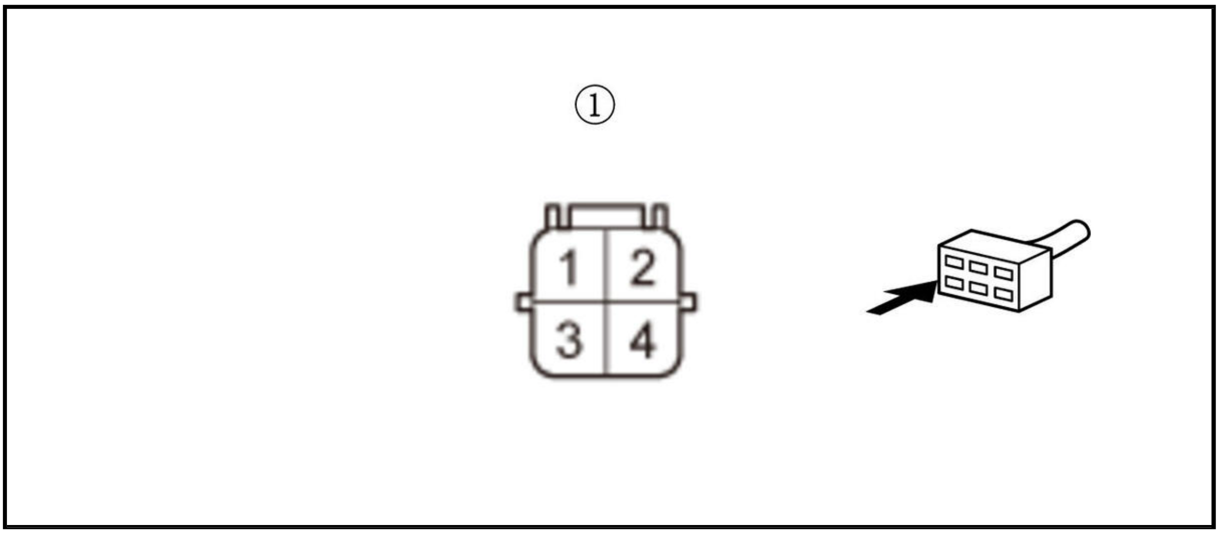
NOTE: Do not close the driver's door.

-3. Disconnect the following connectors.

Brake pedal stroke sensor 4P connector
Electric servo brake control unit 22P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal stroke sensor 4P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	Brake pedal stroke sensor 4P connector (female terminals) No. 1: ①
Test point 2	**Electric servo brake control unit 22P connector No. 12**



Is there 1.0 Ω or less?

YES

The ESB_SVCC wire is OK. Go to step 3.

NO

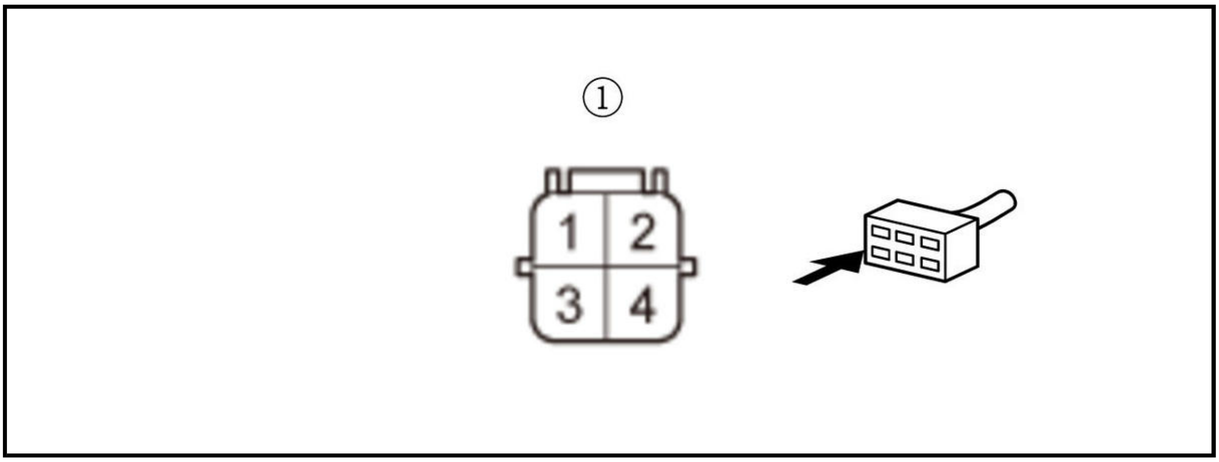
Repair an open in the wire between electric servo brake control unit and the brake pedal stroke sensor.

3. Open wire check (ESV_SGND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal stroke sensor 4P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	**Electric servo brake control unit 22P connector No. 9**

Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The ESV_SGND wire is OK. Go to step 4.

NO

Repair an open in the wire between the electric servo brake control unit and the brake pedal stroke sensor.

4. Shorted wire check (BPS, BPSR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal stroke sensor 4P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected

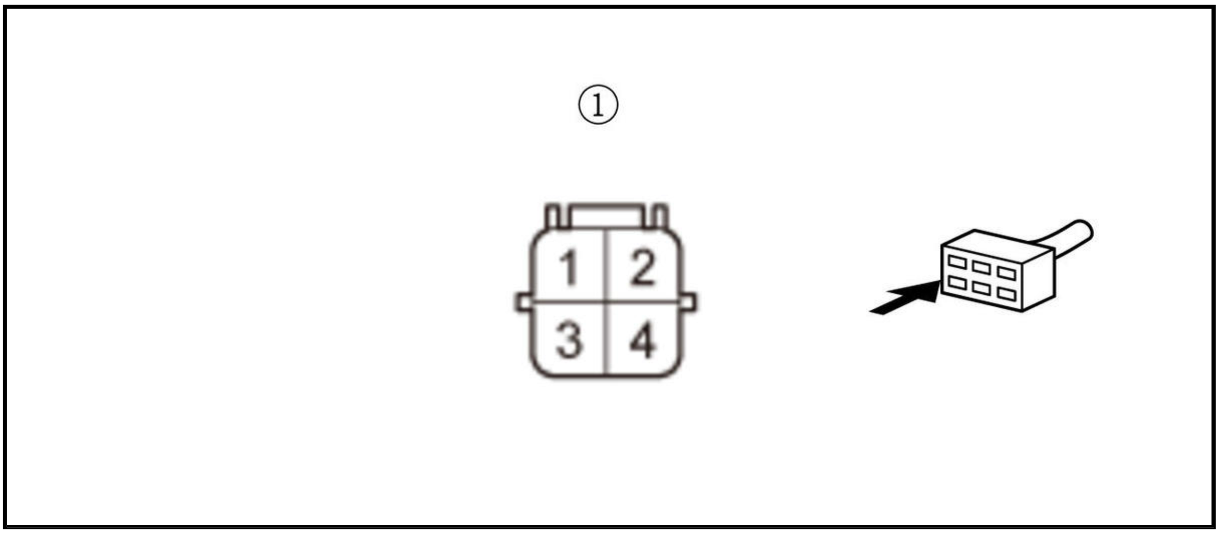
Test circuit 2	B
Test point 1	Brake pedal stroke sensor 4P connector (female terminals) No. 3: ①
Test point 2	Body ground



Is there 1 MΩ or more?

YES

The BPS and BPSR wires are not shorted to ground. Go to step 5.

NO

Repair a short to ground in the wire between electric servo brake control unit and the brake pedal stroke sensor.

5. Open wire check (BPS, BPSR line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal stroke sensor 4P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected

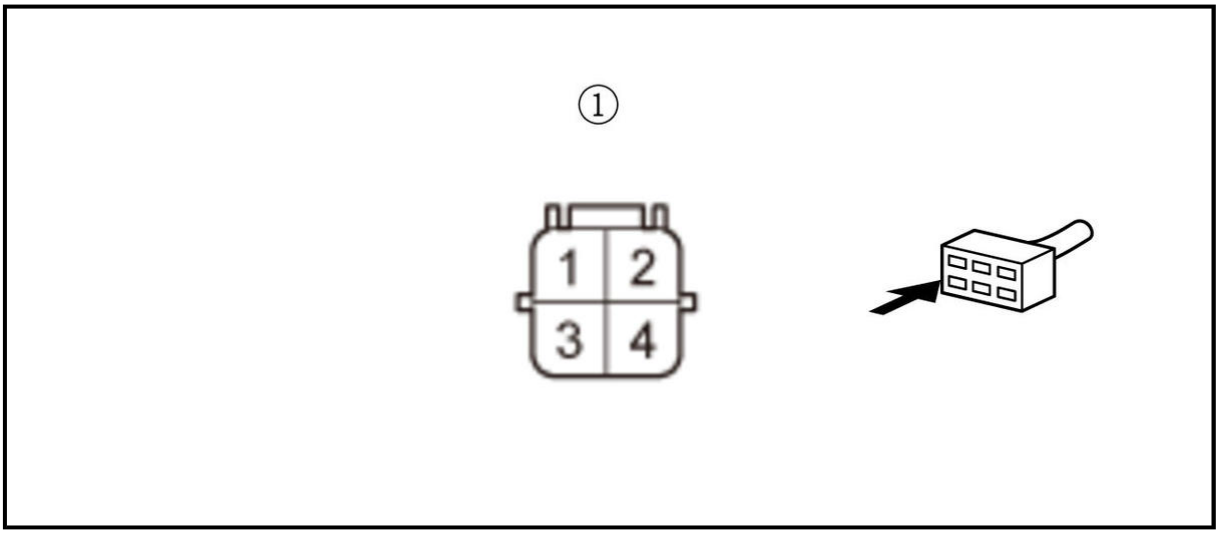
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

The BPS and BPSR wires are OK. Go to step 6.

NO

Repair an open in the wire between electric servo brake control unit and the brake pedal stroke sensor.

6. Brake pedal stroke sensor check

-1. **Substitute a known-good brake pedal** .

-2. Reconnect the following connectors.

Brake pedal stroke sensor 4P connector
Electric servo brake control unit 22P connector

-3. Turn the vehicle to the ON mode.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. Disconnect the following connectors.

Brake pedal stroke sensor 4P connector
Electric servo brake control unit 22P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal stroke sensor 4P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test circuit 1	B
Test point 1	**Electric servo brake control unit 22P connector No. 12**
Test point 2	**Electric servo brake control unit 22P connector No. 8**

Test circuit 2	B
Test point 1	**Electric servo brake control unit 22P connector No. 12**
Test point 2	**Electric servo brake control unit 22P connector No. 11**

Is there 1 MΩ or more?

YES

The BPS, BPSR, and ESB_SVCC wires is OK. Go to step 3.

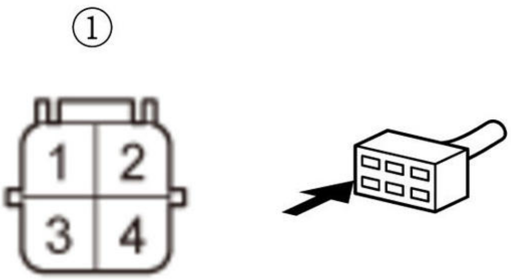
NO

Repair a short in the wire between electric servo brake control unit and the brake pedal stroke sensor.

3. Open wire check (ESV_SGND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Brake pedal stroke sensor 4P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	**Electric servo brake control unit 22P connector No. 9**
Test point 2	Brake pedal stroke sensor 4P connector (female terminals) No. 4: ①



Is there 1.0 Ω or less?

YES

The ESV_SGND wire is OK. Go to step 4.

NO

Repair an open in the wire between the electric servo brake control unit and the brake pedal stroke sensor.

4. Brake pedal stroke sensor check

   -1. **Substitute a known-good brake pedal** .

   -2. Reconnect the following connectors.

Brake pedal stroke sensor 4P connector
Electric servo brake control unit 22P connector

   -3. Turn the vehicle to the ON mode.

   -4. Clear the DTCs with the HDS.

   -5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P057D-00 Brake Pedal Stroke Sensor Circuit High Voltage	B	B
P1E24-00 Brake Pedal Stroke Redundant Sensor Circuit High Voltage	B	B

Is P057D-00 or P1E24-00 indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Replace the original brake pedal .

DTC P0602-00

DTC P0602-00 : Electric Servo Brake Control Unit Programming Error

NOTE:

- **Before you troubleshoot, review the general troubleshooting information** .
- Do not turn the vehicle to the OFF (LOCK) mode while updating the electric servo brake control unit. If you turn the vehicle to the OFF (LOCK) mode before completion, the electric servo brake control unit will be damaged.

DTC Description	DTC	Freeze Frame
P0602-00 Electric Servo Brake Control Unit Programming Error	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P0602-00 Electric Servo Brake Control Unit Programming Error	B	B

Is DTC P0602-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric servo brake control unit check (update)

-1. **Update the electric servo brake control unit** .

-2. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-3. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC P0602-00 indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Troubleshooting is complete.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P0642-00 Sensor Power Source Circuit Low Voltage	B	B

Is DTC P0642-00 or others (Relation of brake pedal stroke sensor failure DTCs or brake fluid pressure sensor failure DTCs) indicated?

YES

The failure is duplicated. Go to step 2.

YES

Go to indicated DTC's troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (ESB_SVCC line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

Electric servo brake control unit 22P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	**Electric servo brake control unit 22P connector No. 12**
Test point 2	Body ground

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (ESB_SVCC line to power)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connectors.

Electric servo brake control unit 22P connector
Tandem motor cylinder 9P connector
Brake pedal stroke sensor 4P connector

-4. Measure the voltage between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
B	Tandem motor cylinder 9P connector: disconnected
B	Brake pedal stroke sensor 4P connector: disconnected
Test point 1	**Electric servo brake control unit 22P connector No. 12**
Test point 2	Body ground
B	B

Is there 0.1 V or more?

YES

Repair a short to power in the wire between the electric servo brake control unit and the tandem motor cylinder or the brake pedal stroke sensor.

NO

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Go to step 3.

3. Shorted wire check (BPS line to BPSR line) 2

-1. Disconnect the following connector.

Brake pedal stroke sensor 4P connector

-2. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
B	Brake pedal stroke sensor 4P connector: disconnect
Test point 1	**Electric servo brake control unit 22P connector No. 8**
Test point 2	**Electric servo brake control unit 22P connector No. 11**

Is there 1 MΩ or more?

YES

Replace the brake pedal .

NO

Repair a short in the wire between the electric servo brake control unit and the brake pedal stroke sensor.

Is DTC P1E42-00 indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

YES

Go to indicated DTC's troubleshooting.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1E46-00, P1E47-00, P1E48-00, P1E4A-00, P1E4C-00

DTC P1E46-00 : Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck ON)

DTC P1E47-00 : Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck OFF)

DTC P1E48-00 : Slave Cylinder Drive Motor Current Malfunction (Offset)

DTC P1E4A-00 : Slave Cylinder Drive Motor Current Malfunction (Over Current)

DTC P1E4C-00 : Slave Cylinder Drive Motor Power Source Circuit High Voltage

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P1E46-00 Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck ON)	B	B
P1E47-00 Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck OFF)	B	B
P1E48-00 Slave Cylinder Drive Motor Current Malfunction (Offset)	B	B
P1E4A-00 Slave Cylinder Drive Motor Current Malfunction (Over Current)	B	B
P1E4C-00 Slave Cylinder Drive Motor Power Source Circuit High Voltage	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 1 second or more without pressing the brake pedal.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E46-00 Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck ON)	B	B
P1E47-00 Electric Servo Brake Control Unit Internal Circuit Malfunction (FET Stuck OFF)	B	B
P1E48-00 Slave Cylinder Drive Motor Current Malfunction (Offset)	B	B
P1E4A-00 Slave Cylinder Drive Motor Current Malfunction (Over Current)	B	B
P1E4C-00 Slave Cylinder Drive Motor Power Source Circuit High Voltage	B	B

   Is DTC P1E46-00, P1E47-00, P1E48-00, P1E4A-00, or P1E4C-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Shorted wire check (MV, MU, MW lines to power) 1

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. Disconnect the following connector.

Electric servo brake control unit 22P connector

   -4. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected

Connector	Test point 1	Test point 2
Electric servo brake control unit 22P connector	No. 1	Body ground

Connector	Test point 1	Test point 2
	No. 2	
	No. 3	

Is there 0.1 V or more?

YES

Go to step 3.

NO

Go to step 4.

3. Shorted wire check (MV, MU, MW lines to power) 2

-1. Disconnect the following connector.

Tandem motor cylinder 9P connector

-2. Measure the voltage between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
B	Tandem motor cylinder 9P connector: disconnected

Connector	Test point 1	Test point 2
Electric servo brake control unit 22P connector	No. 1	Body ground
	No. 2	
	No. 3	

Is there 0.1 V or more?

YES

Repair a short to power in the wire between the electric servo brake control unit and the tandem motor cylinder.

NO

Replace the motor .

4. Shorted wire check (MV, MU, MW lines) 1

-1. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected

Connector	Test point 1	Test point 2
Electric servo brake control unit 22P connector	No. 1	Body ground
	No. 2	
	No. 3	

Is there 1 MΩ or more?

YES

Go to step 6.

NO

Go to step 5.

5. Shorted wire check (MV, MU, MW lines) 2

-1. Disconnect the following connector.

Tandem motor cylinder 9P connector

-2. Measure the resistance between the following test points and body ground individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
B	Tandem motor cylinder 9P connector: disconnected

Connector	Test point 1	Test point 2
Electric servo brake control unit 22P connector	No. 1	Body ground
	No. 2	
	No. 3	

Is there 1 MΩ or more?

YES

Replace the motor .

NO

Repair a short to body ground in the wire between electric servo brake control unit and the tandem motor cylinder.

6. Shorted wire check (MV, MU, MW lines wire to wire)

-1. Disconnect the following connector.

Tandem motor cylinder 9P connector

-2. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
B	Tandem motor cylinder 9P connector: disconnected

Connector	Test point 1	Test point 2
Electric servo brake control unit 22P connector	No. 1	No. 2
		No. 3
	No. 2	No. 1
		No. 3
	No. 3	No. 1
		No. 2

Is there 1 MΩ or more?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the electric servo brake control unit/pedal feel simulator .

NO

Repair a short in the wires between the electric servo brake control unit and the tandem motor cylinder.

DTC P1E49-00, P1E4B-00

DTC P1E49-00 : Slave Cylinder Drive Motor Current Malfunction (Stuck)

DTC P1E4B-00 : Slave Cylinder Drive Motor Circuit Open

NOTE: Before you troubleshoot, review the general troubleshooting information .

DTC Description	DTC	Freeze Frame
P1E49-00 Slave Cylinder Drive Motor Current Malfunction (Stuck)	B	B
P1E4B-00 Slave Cylinder Drive Motor Circuit Open	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Press the brake pedal several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E49-00 Slave Cylinder Drive Motor Current Malfunction (Stuck)	B	B
P1E4B-00 Slave Cylinder Drive Motor Circuit Open	B	B

   Is DTC P1E49-00 or P1E4B-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Open wire check (MV, MU, MW lines) 1

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

Electric servo brake control unit 22P connector

-4. Check for continuity between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected

Connector	**Test point 1**	**Test point 2**
Electric servo brake control unit 22P connector	No. 1	No. 2
		No. 3
	No. 2	No. 1
		No. 3
	No. 3	No. 1
		No. 2

Is there continuity?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Go to step 3.

3. Open wire check (MV, MU, MW lines) 2

-1. Disconnect the following connector.

Tandem motor cylinder 9P connector

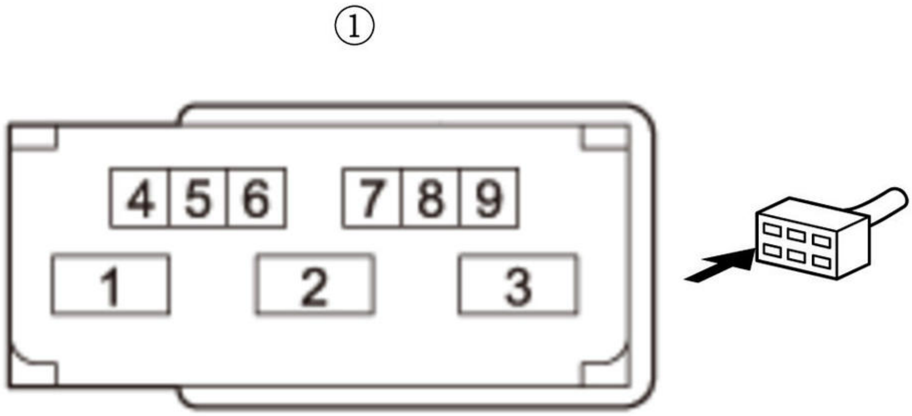
-2. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode
B	Electric servo brake control unit 22P connector: disconnected
B	Tandem motor cylinder 9P connector: disconnected
Test circuit 1	B
Test point 1	**Electric servo brake control unit 22P connector No. 1**
Test point 2	Tandem motor cylinder 9P connector (female terminals) No. 2: ①

Test circuit 2	B
Test point 1	**Electric servo brake control unit 22P connector No. 2**
Test point 2	Tandem motor cylinder 9P connector (female terminals) No. 1: ①

Test circuit 3	B
Test point 1	**Electric servo brake control unit 22P connector No. 3**

Test point 2	Tandem motor cylinder 9P connector (female terminals) No. 3: ①



Is there 1.0 Ω or less?

YES

Replace the motor .

NO

Repair an open in the wire between the electric servo brake control unit and the tandem motor cylinder.

DTC P1E4D-00

DTC P1E4D-00 : Motor Angle Signal Malfunction

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P1E4D-00 Motor Angle Signal Malfunction	B	B

DTC (Electric servo brake)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Press the brake pedal several times.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E4D-00 Motor Angle Signal Malfunction	B	B

Is DTC P1E4D-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Determine possible failure area (HALL lines, others)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

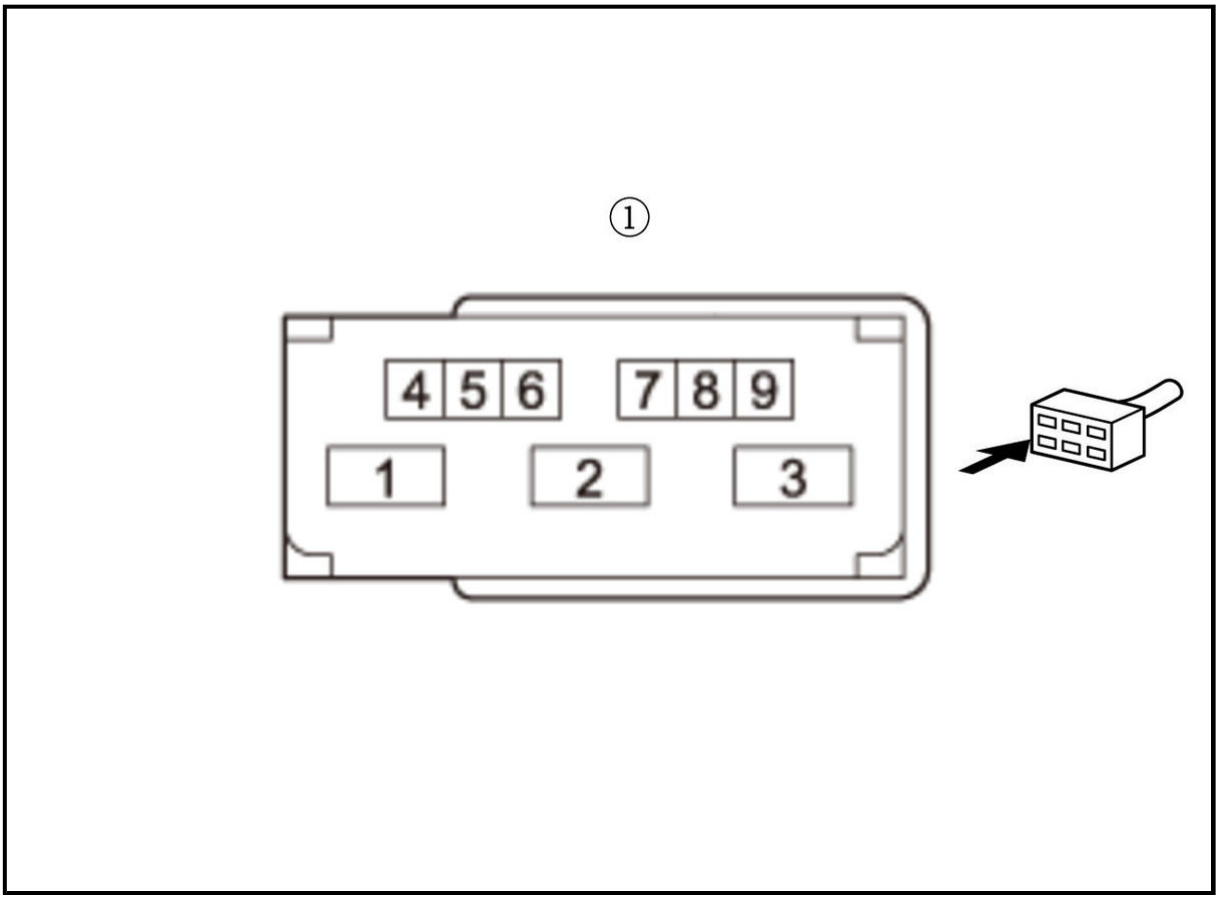
-3. Disconnect the following connector.

Tandem motor cylinder 9P connector

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Tandem motor cylinder 9P connector: disconnected
Test point 1	Tandem motor cylinder 9P connector (female terminals) No. 4: ①
Test point 2	Tandem motor cylinder 9P connector (female terminals) No. 9: ①



Is there about 5 V?

YES

Go to step 5.

NO

Go to step 3.

3. Open wire check (ESB_SVCC line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

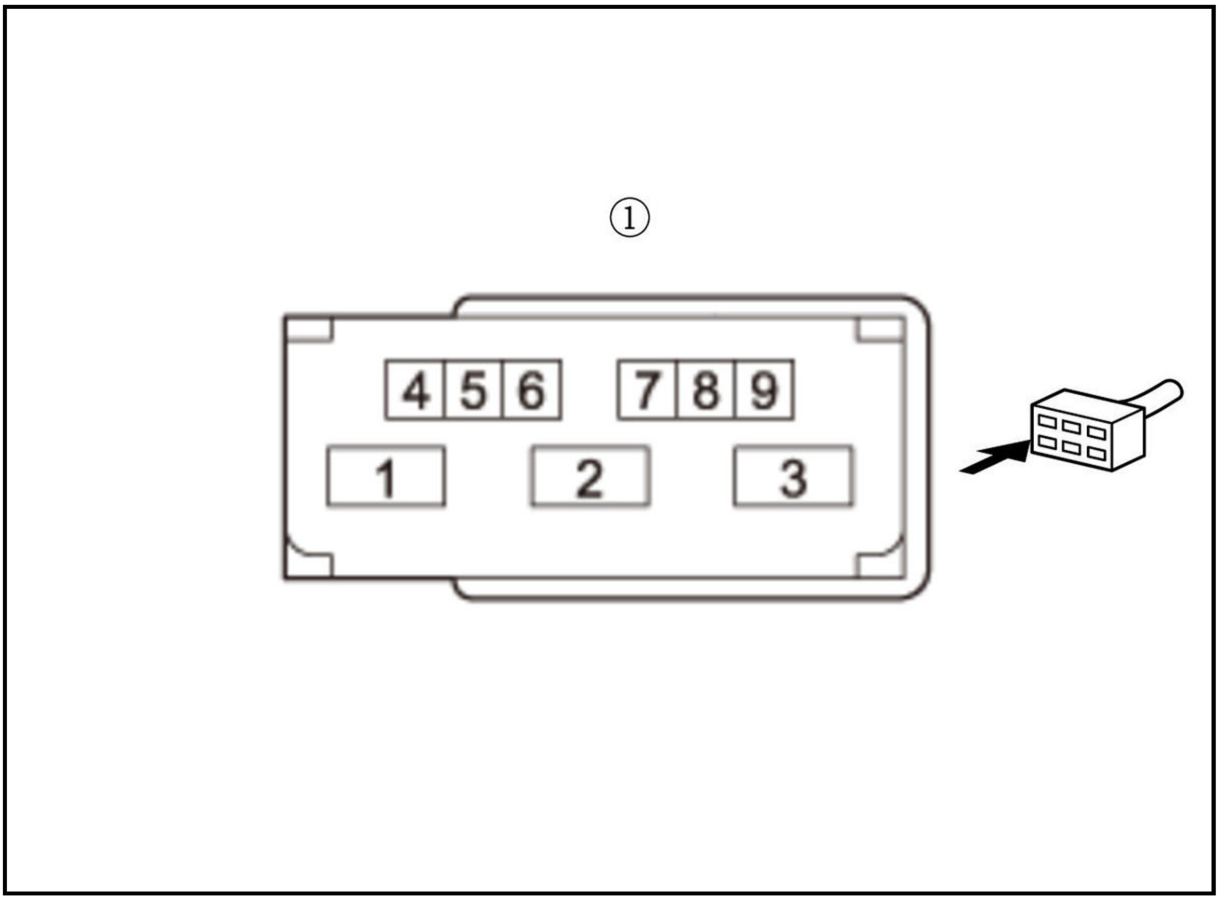
NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

Electric servo brake control unit 22P connector

-4. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tandem motor cylinder 9P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	Tandem motor cylinder 9P connector (female terminals) No. 4: ①
Test point 2	**Electric servo brake control unit 22P connector No. 12**



Is there 1.0 Ω or less?

YES

The ESB_SVCC wire is OK. Go to step 4.

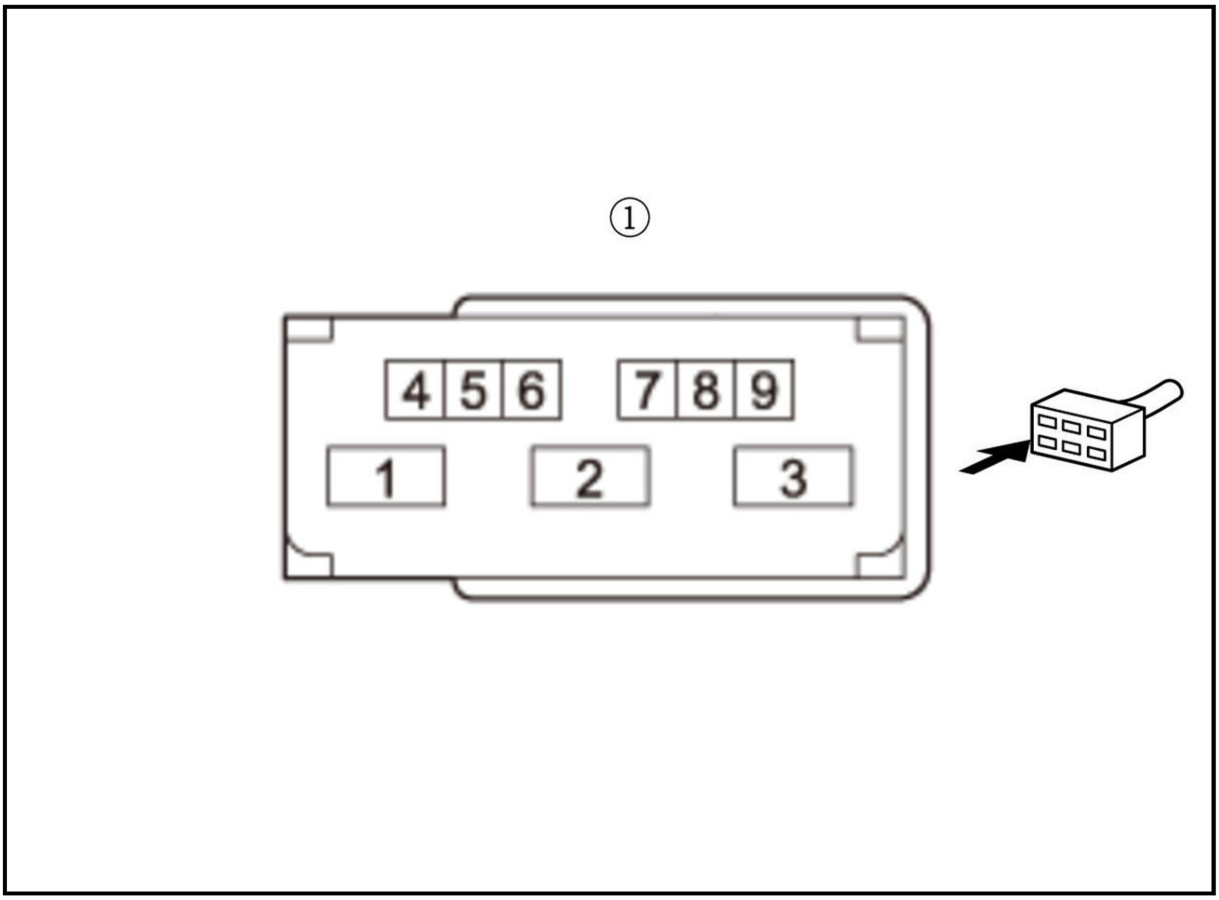
NO

Repair an open in the wire between the electric servo brake control unit and the tandem motor cylinder.

4. Open wire check (ESV_SGND line)

-1. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Tandem motor cylinder 9P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	Tandem motor cylinder 9P connector (female terminals) No. 9: ①
Test point 2	**Electric servo brake control unit 22P connector No. 9**



Is there 1.0 Ω or less?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the wire between the electric servo brake control unit and the tandem motor cylinder.

5. Open wire check (HALL lines)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

Electric servo brake control unit 22P connector

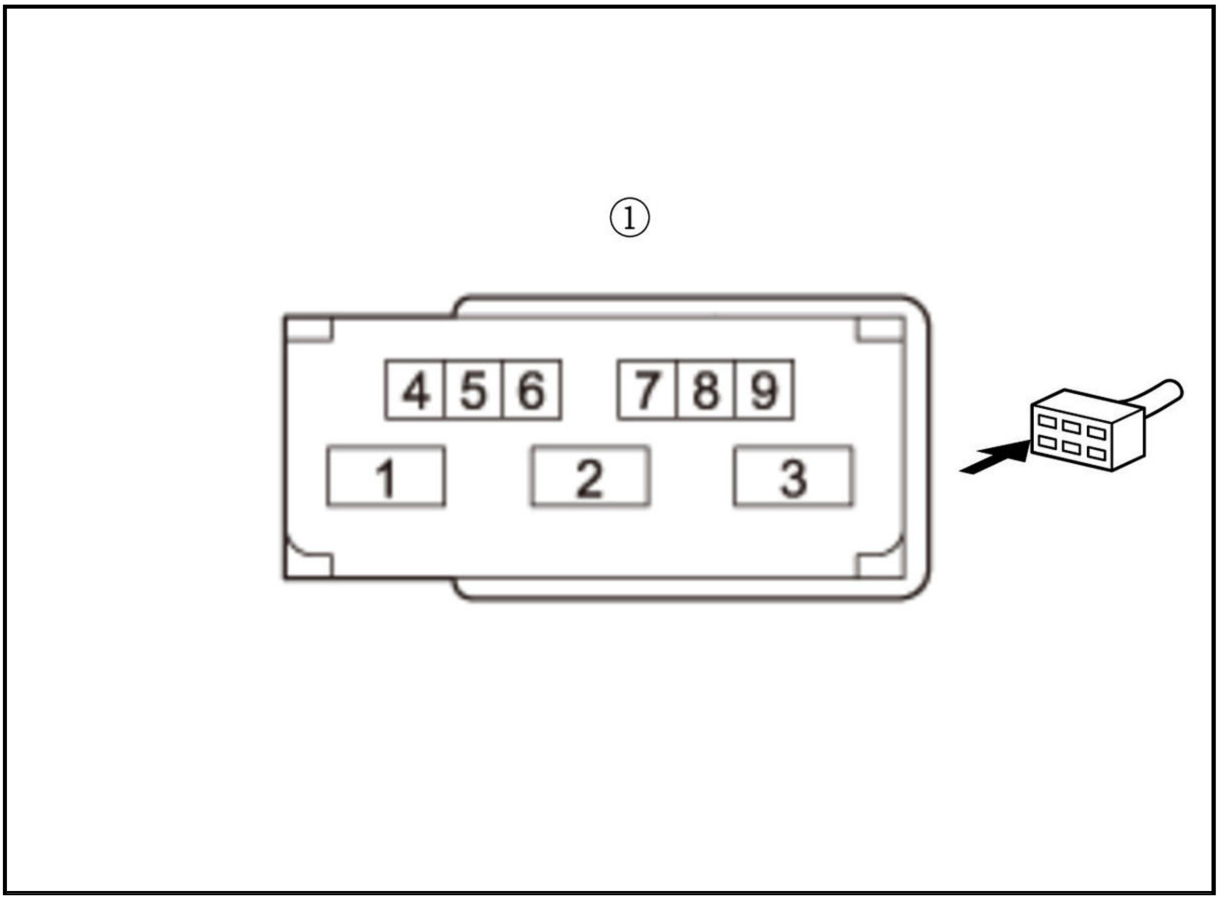
-4. Measure the resistance between test points 1 and 2 individually.

Test condition	Vehicle OFF (LOCK) mode
B	Tandem motor cylinder 9P connector: disconnected
B	Electric servo brake control unit 22P connector: disconnected
Test circuit 1	B
Test point 1	Tandem motor cylinder 9P connector (female terminals) No. 6: ①

Test point 2	**Electric servo brake control unit 22P connector No. 20**

Test circuit 2	B
Test point 1	Tandem motor cylinder 9P connector (female terminals) No. 7: ①
Test point 2	**Electric servo brake control unit 22P connector No. 21**

Test circuit 3	B
Test point 1	Tandem motor cylinder 9P connector (female terminals) No. 8: ①
Test point 2	**Electric servo brake control unit 22P connector No. 22**



Is there 1.0 Ω or less?

YES

The HALL wires are not open. Go to step 6.

NO

Repair an open in the wire between the electric servo brake control unit and the tandem motor cylinder.

6. Shorted wire check (HALL U, HALL V, HALL W lines)

   -1. Measure the resistance between the appropriate electric servo brake control unit 22P connector terminal and body ground individually (see table).

Test condition	Vehicle OFF (LOCK) mode
B	Tandem motor cylinder 9P connector
B	Electric servo brake control unit 22P connector: disconnected

Connector	Test point 1	Test point 2
Electric servo brake control unit 22P connector	No. 20	Body ground
	No. 21	
	No. 22	

Is there 1 MΩ or more?

YES

Go to step 7.

NO

Repair a short to body ground in the wire between the electric servo brake control unit and the tandem motor cylinder.

7. Motor check

-1. **Substitute a known-good motor** .

-2. Reconnect all connectors.

-3. Turn the vehicle to the ON mode.

-4. Clear the DTCs with the HDS.

-5. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-6. Press the brake pedal several times.

-7. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E4D-00 Motor Angle Signal Malfunction	B	B

Is DTC P1E4D-00 indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Replace the original motor .

DTC P1E51-00

DTC P1E51-00 : Tandem Motor Cylinder Gearbox Mechanical Linkage Failure

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P1E51-00 Tandem Motor Cylinder Gearbox Mechanical Linkage Failure	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 10 seconds or more without pressing the brake pedal.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E51-00 Tandem Motor Cylinder Gearbox Mechanical Linkage Failure	B	B

   Is DTC P1E51-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Tandem motor cylinder check

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. **Inspect the tandem motor cylinder** .

   Is related parts damaged?

   YES

   Replace the gearbox or the motor .

   NO

   Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

DTC P1E52-00

DTC P1E52-00 : Tandem Motor Cylinder Gearbox Stuck

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P1E52-00 Tandem Motor Cylinder Gearbox Stuck	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Press the brake pedal several times.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E52-00 Tandem Motor Cylinder Gearbox Stuck	B	B

Is DTC P1E52-00 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections between the electric servo brake control unit and tandem motor cylinder connector(s). Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the gearbox or the motor** .

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

DTC P1E63-00

DTC P1E63-00 : Brake Pedal Stroke Sensor Signal Stuck

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P1E63-00 Brake Pedal Stroke Sensor Signal Stuck	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Press the brake pedal hard, then release.

   -5. Wait 3 minutes or more.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E63-00 Brake Pedal Stroke Sensor Signal Stuck	B	B

Is DTC P1E63-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Brake pedal stroke sensor check

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. **Substitute a known-good brake pedal** .

-4. Turn the vehicle to the ON mode.

-5. Clear the DTCs with the HDS.

-6. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-7. Press the brake pedal hard, then release.

-8. Wait 3 minutes or more.

-9. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
B	B	B

Is DTC P1E63-00 indicated?

YES

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Replace the original brake pedal .

DTC P1E68-00

DTC P1E68-00 : Brake Master Cylinder Cut Valve Self Lock

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P1E68-00 Brake Master Cylinder Cut Valve Self Lock	B	B

DTC (Electric servo brake)

1. DTC check

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 10 seconds or more without pressing the brake pedal.

   -5. Press the brake pedal hard, then release.

   -6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P1E51-00 Tandem Motor Cylinder Gearbox Mechanical Linkage Failure	B	B
P1E52-00 Tandem Motor Cylinder Gearbox Stuck	B	B
P1E68-00 Brake Master Cylinder Cut Valve Self Lock	B	B

   Is DTC P1E68-00 indicated?

   YES

   If only DTC P1E68-00 is indicated, go to step 2.

   YES

   If DTC P1E51-00 or P1E52-00 are also indicated, **go to indicated DTC's troubleshooting** .

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Tandem motor cylinder check

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. **Inspect the tandem motor cylinder** .

   Is related parts damaged?

   YES

   Replace the gearbox or the motor .

   NO

   Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

DTC P2531-00

DTC P2531-00 : Electric Servo Brake Control Unit Power Source Circuit (IG1) Low Voltage

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P2531-00 Electric Servo Brake Control Unit Power Source Circuit (IG1) Low Voltage	B	B

DTC (Electric servo brake)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTCs with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait for 5 seconds.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P2531-00 Electric Servo Brake Control Unit Power Source Circuit (IG1) Low Voltage	B	B

   Is DTC P2531-00 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. Check the following fuse.

Fuse	**No. D4**

   Is the fuse OK?

   YES

   The fuse is OK. Reinstall the fuse, then go to step 3.

   NO

Replace the fuse. Turn the vehicle to the ON mode, then to the OFF (LOCK) mode. If the fuse blows again, repair the short to ground on the No. D4 fuse circuit.

3. Open wire check (IG1_HAC line)

-1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

-2. Wait for 3 minutes.

NOTE: Do not close the driver's door.

-3. Disconnect the following connector.

Electric servo brake control unit 22P connector

-4. Turn the vehicle to the ON mode.

-5. Measure the voltage between test points 1 and 2.

Test condition	Vehicle ON mode
B	Electric servo brake control unit 22P connector: disconnected
Test point 1	**Electric servo brake control unit 22P connector No. 17**
Test point 2	Body ground

Is there battery voltage?

YES

The IG1_HAC wire is OK. Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the IG1_HAC wire between the **No. D4** fuse and the electric servo brake control unit.

DTC P2532-00

DTC P2532-00 : Electric Servo Brake Control Unit Power Source Circuit (IG1) High Voltage

NOTE: **Before you troubleshoot, review the general troubleshooting information** .

DTC Description	DTC	Freeze Frame
P2532-00 Electric Servo Brake Control Unit Power Source Circuit (IG1) High Voltage	B	B

DTC (Electric servo brake)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Wait for 5 seconds or more.

-5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
P2532-00 Electric Servo Brake Control Unit Power Source Circuit (IG1) High Voltage	B	B

Is DTC P2532-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Electric servo brake control unit check

-1. Check the parameter(s) below with the HDS.

Signal	Threshold		Current conditions	
	Values	Unit	Values	Unit
Ignition Voltage	More than 17.96	V	B	B

Do the current condition(s) match the threshold?

YES

Check the 12 volt battery , and **check the electric powertrain system DTCs** .

NO

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

DTC U0029-00, U0047-00 (ELECTRIC SERVO BRAKE CONTROL UNIT)

DTC U0029-00 : F-CAN Malfunction (BUS-OFF)

U0047-00 F-CAN Malfunction (Ch2 Bus-OFF)/Vehicle Communication Bus C Performance	B	B

Is DTC U0029-00 or U0047-00 indicated?

YES

The failure is duplicated. Go to step 2.

NO

Intermittent failure, the system is OK at this time. **Refer to intermittent failures troubleshooting** . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. DTC check (CAN gateway system)

-1. Check for CAN gateway system DTCs with the HDS.

DTC Description	DTC
B	B

Are DTC(s) indicated?

YES

Go to indicated DTC's troubleshooting.

NO

Go to step 3.

3. F-CAN circuit communication check

-1. Select the FUNCTION TEST in the CAN gateway with the HDS, then select the F-CAN Bus Connected Unit Check.

F-CAN Bus Connected Unit Check

Which result is indicated?

Electric servo brake control unit (Bus B) is Not Available

Go to step 4.

Electric servo brake control unit (Bus C) is Not Available

Go to step 5.

Electric servo brake control unit (Bus B and C) is Available

Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

4. Open wire check (F-CAN B_H, F-CAN B_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Electric servo brake control unit 22P connector
CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode

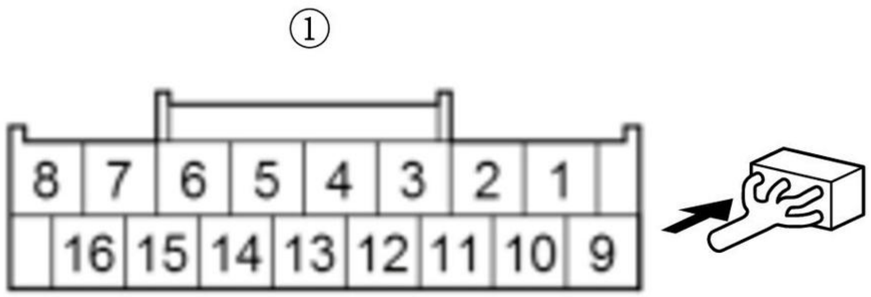
Test point 1	**Electric servo brake control unit 22P connector No. 14**
Test point 2	CAN gateway 16P connector (female terminals) No. 14: ①



Is there 1.0 Ω or less?

YES

The F-CAN B_H and F-CAN B_L wires are OK. Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the wire between the electric servo brake control unit and the CAN gateway.

5. Open wire check (F-CAN C_H, F-CAN C_L lines)

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. Disconnect the following connectors.

Electric servo brake control unit 22P connector

CAN gateway 16P connector

-3. Measure the resistance between test points 1 and 2.

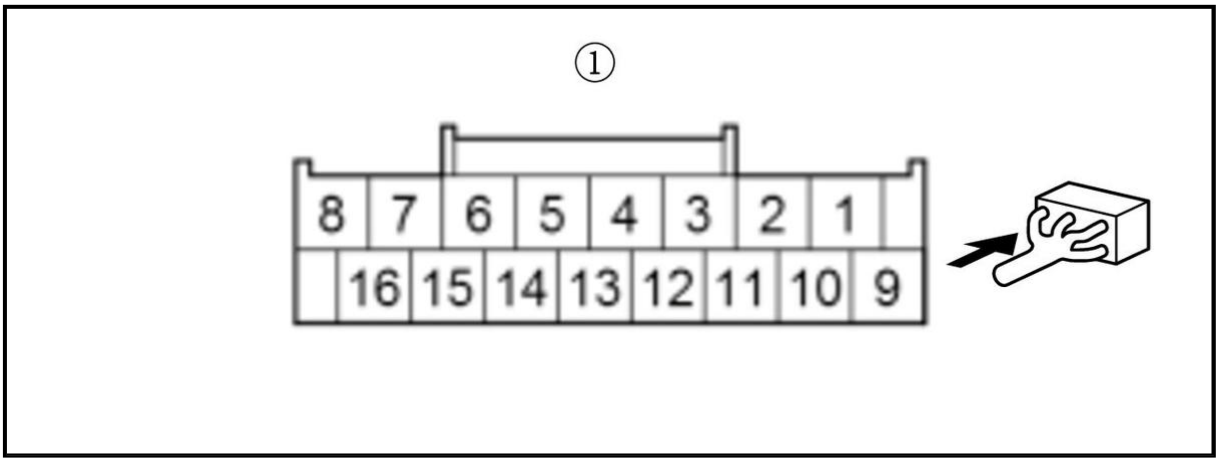
Test point 1	**Electric servo brake control unit 22P connector No. 18**
Test point 2	CAN gateway 16P connector (female terminals) No. 13: ①



Is there 1.0 Ω or less?

YES

The F-CAN C_H and F-CAN C_L wires are OK. Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, **replace the electric servo brake control unit/pedal feel simulator** .

NO

Repair an open in the wire between the electric servo brake control unit and the CAN gateway.

DTC Description	DTC	Freeze Frame
U3000-49 Driver's Door Switch Signal Stuck On (ECU Internal Malfunction)	B	B

DTC (Electric servo brake)

1. Problem verification

-1. Turn the vehicle to the ON mode.

-2. Clear the DTCs with the HDS.

-3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

-4. Open and close the driver's door several times.

-5. Wait for 2 minutes or more.

-6. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
U3000-49 Driver's Door Switch Signal Stuck On (ECU Internal Malfunction)	B	B

Is DTC U3000-49 indicated?

YES

The failure is duplicated. Check for loose terminals and poor connections in the electric servo brake control unit 22P connector. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting. If they are OK, replace the electric servo brake control unit/pedal feel simulator .

NO

Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

   Is DTC U3003-16 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. Refer to intermittent failures troubleshooting . If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. Fuse check

   -1. Turn the vehicle to the OFF (LOCK) mode with driver's door open.

   -2. Wait for 3 minutes.

   NOTE: Do not close the driver's door.

   -3. Check the following fuse.

Fuse	No. A1-2

Is the fuse OK?

YES

The fuse is OK. Reinstall the fuse, then go to step 3.

NO

Replace the fuse. If the fuse blows again, repair a short to ground in the No. A1-2 fuse circuit.

3. Open wire check (+B_ESB line)

-1. Disconnect the following connector.

NOTE: Use new mounting screws during reassembly.

3. Remove the O-ring (C).

NOTE:

- Replace the O-ring whenever the electric parking brake actuator is removed.
- When installing the actuator, make sure there is no foreign matter on the mating surfaces and the O-ring.

4. All Removed Parts - Install

1. Install all removed parts in the reverse order of removal.

5. Electric Parking Brake Actuator After Install - Check

1. Turn the vehicle to the ON mode.

2. Apply and release the parking brake 2 times, then make sure that the brake system indicator (red) goes OFF.

NOTE: If the brake system indicator (red) does not go OFF, check for a poor connection at the electric parking brake actuator connector.

3. Turn the vehicle to the OFF (LOCK) mode.

DESCRIPTION & OPERATION

ELECTRIC PARKING BRAKE SYSTEM DESCRIPTION

Overview

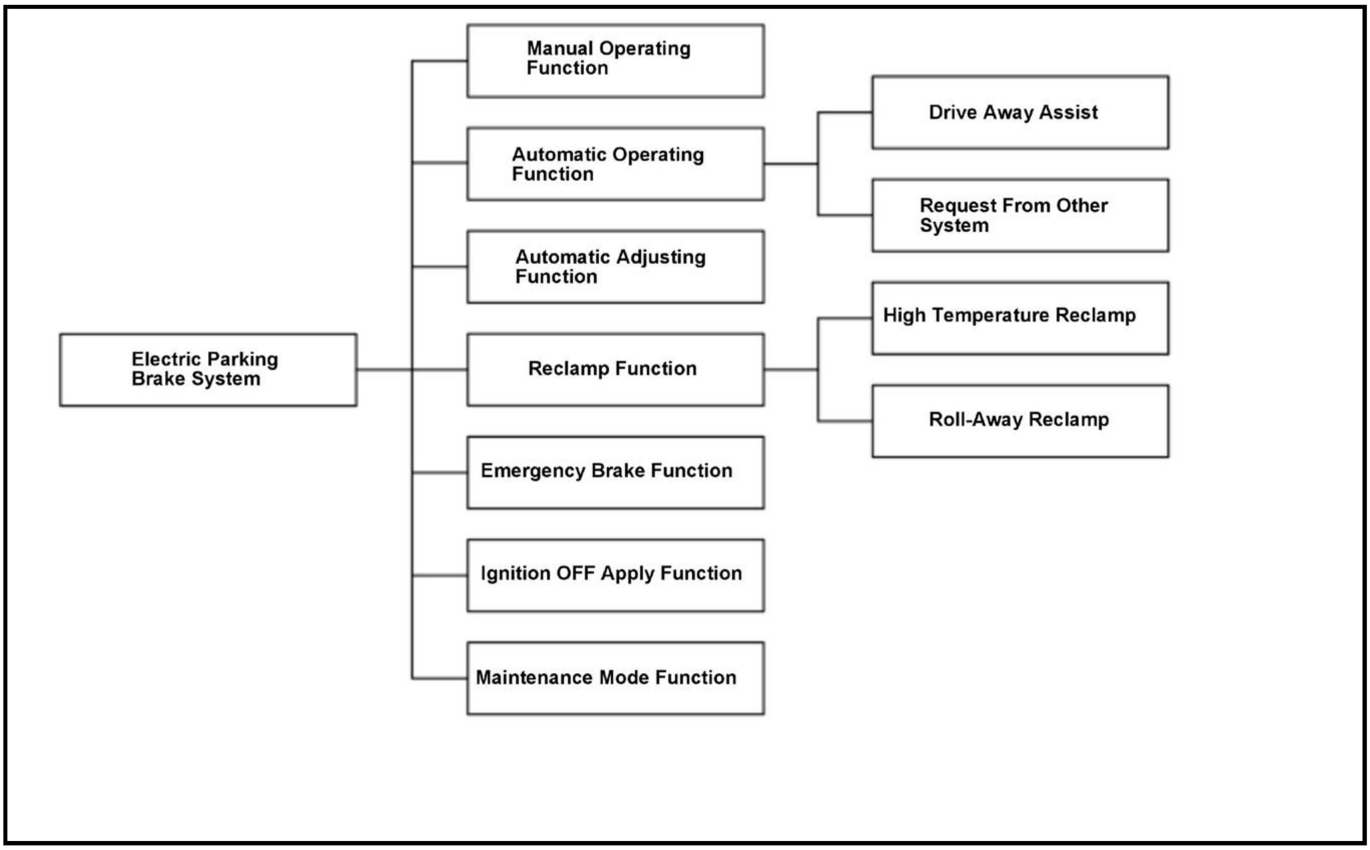
The electric parking brake system replaces the traditional parking brake pedal or lever and linkage with an electrically controlled parking brake mechanism in the rear calipers. This reduces driver effort and provides additional features such as:

- Simple electric switch operation
- Parking brake release upon acceleration
- Automatic rollaway prevention

The system is controlled by the VSA modulator-control unit.

Function

The electric parking brake system has following functions.



Electric Parking Brake System
Manual Operating Function
Automatic Operating Function
Automatic Adjusting Function
Reclamp Function
Emergency Brake Function
Ignition OFF Apply Function
Maintenance Mode Function
Drive Away Assist
Request From Other System
High Temperature Reclamp
Roll-Away Reclamp

Manual Operating Function

The electric parking brake can be manually applied and released using the switch. Pulling up on the electric parking brake switch applies the parking brake. Firmly applying the brake pedal and pushing down on the electric parking brake switch releases it.

Automatic Operating Function - Drive Away Assist

The electric parking brake is released automatically when the vehicle is driven away from a stop with the driver's seat belt buckled. Problems in the electric parking brake switch circuits do not affect automatic apply and release.

Automatic Operating Function - Request From Other System

While the electric servo brake system is preventing vehicle movement during automatic brake hold control, the electric parking brake system may operate automatically. This will occur after a specific time period has elapsed based on commands sent from the electric servo brake system.

Automatic Adjusting Function

Because the parking brake is automatically adjusted whenever applying the parking brake, the electric parking brake needs no adjustment. And, if the vehicle is driven 625 miles (1, 000 km) without applying the parking brake, the parking brake is automatically applied and released while vehicle is at a short stop, and adjusts the remaining brake pads.

Reclamp Function - High Temperature Reclamp

Brake disc temperature is calculated from the vehicle's kinetic energy as it stops, because loss of clamping force can occur when brake system components contract as they cool. If the calculated brake temperature exceeds a predetermined threshold, the high temperature reclamp function reapplies the electric parking brake actuators after a cool-down time has elapsed to compensate for any loss of clamping force. In order to accommodate this function, the VSA modulator-control unit may be kept on for a period of time after the turning the vehicle to the OFF (LOCK) mode. Depending on when high temperature reclamp occurs, the driver may notice the motor noise.

Reclamp Function - Roll-Away Reclamp

The roll-away reclamp function reapplies the parking brake if wheel movement is detected after the electric parking brake is applied.

Emergency Brake Function

In an emergency situation, such as a failure of the conventional brake system, the electric parking brake system performs the emergency brake function by activating the electric parking brake switch continuously. There are two controls depending on the state of the electric servo brake system.

- **In cases where the electric servo brake system can perform the servo control:**

  The electric parking brake system sends the brake control request to the electric servo brake system which applies the emergency brake using the servo control.

- **In cases where the electric servo brake system can not perform the servo control:**

  The electric parking brake system controls the electric parking brake actuator so that the wheels do not lock, and applies the emergency brake instead of the electric servo brake system. However, if the wheel speed signal is abnormal, the anti-lock control is not performed.

Ignition OFF Apply Function

The electric parking brake system can apply the parking brake automatically when the vehicle is turned to the OFF (LOCK) mode based on customer preferences. It may be necessary to temporarily cancel this function in certain service procedures. **Refer to How To Temporarily Cancel Automatic Electric Parking Brake**. For more information on how to turn on or off the automatic parking brake function, refer to the owner's manual.

Maintenance Mode

The electric parking brake system has a brake pad maintenance mode functional test. This test fully releases the parking brake mechanism so that brake service, such as rear pad replacement, can be done. Maintenance mode can be activated by the HDS.

ELECTRIC PARKING BRAKE SYSTEM DESCRIPTION - COMPONENTS

The electric parking brake system consists of the following primary components:

- VSA modulator-control unit
- Electric parking brake actuators
- Electric parking brake switch
- System indicator

For locations of each component on the vehicle, **refer to Component Location Index** , and for functions of the indicator, **refer to How to Troubleshoot the Electric Parking Brake**.

Electric Parking Brake Actuator

The electric parking brake actuator has a built-in DC motor. When the motor operates, the motor's speed is reduced by the actuator, increasing torque. The actuator turns the spindle and the adjuster nut inside the caliper piston force it outward to generate brake pad clamping force. The electric parking brake actuators are automatically adjusted to compensate for brake pad wear, so no parking brake adjustment is necessary.

ACTUATOR
PISTON
ADJUSTER NUT
SPINDLE

When the electric parking brake system has a malfunction and the parking brake cannot be released, you can release the parking brake by doing the forced cancellation procedure. **Refer to the forced cancellation procedure**.

Electric Parking Brake Switch

The electric parking brake switch is connected to the VSA modulator-control unit using four separate circuits. The control unit must see the correct voltage patterns on all four circuits, or the switch will be disabled and a DTC will be set.

GENERAL INFORMATION

HOW TO TEMPORARILY CANCEL AUTOMATIC ELECTRIC PARKING BRAKE

Procedure

NOTE:

- The electric parking brake on this vehicle has the ability to apply itself once the vehicle is turned to the OFF (LOCK) mode based on the customer's preferences. During certain service procedures, it may be necessary to turn off this function temporarily.
- Refer to the owner's manual for more information on how to turn on or off the automatic parking brake function.

For more information, **refer to the Electric Parking Brake System Description**.

1. Temporary Cancellation

> **NOTE:** Before doing this procedure, turn off the ACC function (if equipped) and the automatic brake hold function.
>
> 1. Park the vehicle with the vehicle in the ON mode.
>
> 2. Turn the vehicle to the OFF (LOCK) mode, then within 2 seconds release the electric parking brake.

SERVICE PROCEDURE

ELECTRIC PARKING BRAKE SYSTEM FORCED CANCELLATION

Procedure

NOTE: Forced cancellation is performed when the system is abnormal and the parking brake cannot be released.

1. **Vehicle - Lift**
2. **Rear Wheel - Remove**
3. **Electric Parking Brake Actuator - Remove**
4. Parking Brake - Forced Cancel

	1. Using a TORX driver, turn the spindle shaft (A) clockwise until parking brake is released.

HOW TO INFORMATION

HOW TO TROUBLESHOOT THE ELECTRIC PARKING BRAKE SYSTEM

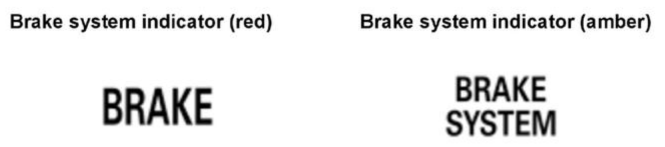
Control Unit

The vehicle is equipped with the electric parking brake and the system is controlled by the VSA modulator-control unit.

NOTE: For DTCs of the electric parking brake system, please check from the ABS/VSA menu in the HDS.

System Indicator

This system has two indicators on the gauge control module.



NOTE: For locations of each indicator, refer to gauge control module component location index .

When the system is OK, each indicator comes on for about 2 seconds after turning the vehicle to the ON mode, then it goes off. If the parking brake is applied, the brake system indicator (red) is still ON.

Brake System Indicator (Amber)

- The brake system indicator (amber) comes on when the electric parking brake function is lost.
- The brake system indicator (amber) will also illuminate when the HDS maintenance mode is enabled.

Brake System Indicator (Red)

- The brake system indicator (red) comes on when the electric parking brake is applied.
- The brake system indicator (red) blinks when the electric parking brake function is lost.

Diagnostic Trouble Code (DTC)

- The memory can hold 10 DTCs. However, when the same DTC is detected more than once, the more recent DTC is written over the earlier one. Therefore, when the same problem is detected repeatedly, it is memorized as a single DTC.
- The DTCs are indicated in ascending order, not in the order they occurred.
- The DTCs are memorized in an EEPROM in the VSA modulator-control unit. Therefore, the memorized DTCs cannot be erased by disconnecting the 12 volt battery. Do the specified procedures to clear the DTCs.

Self-Diagnosis

- Self-diagnosis can be classified into two categories:
-
    - -

      Initial diagnosis: Done right after turning the vehicle to the ON mode and until the brake system indicator (amber) goes off.
-
    - -

      Regular diagnosis: Done right after the initial diagnosis until turning the vehicle to the OFF (LOCK) mode.
- When the system detects a problem, the VSA modulator-control unit shifts to fail-safe mode.

Electric Parking Brake Actuator

- The electric parking brake actuator operates when the parking brake applies or releases.
- The parking brake motor can be heard at the rear wheels when the parking brake is applied or released, this is normal.

Electric Parking Brake Forced Cancellation

- When the electric parking brake system has malfunction and parking brake cannot be released, you can release parking brake by doing forced cancellation procedure.
- Before doing electric parking brake forced cancellation, check for electric parking brake system DTCs with the HDS. If any DTCs are indicated, do the indicated DTC's troubleshooting and repair the cause for DTC first.
- If the electric parking brake switch fails, switch operation will be disabled and the manual release is not possible. However, depending on the malfunction, you may be able to release the parking brake by following procedures.
-
    - Buckle the driver's seat belt.
    - Turn the vehicle to the READY TO DRIVE mode.
    - Shift the transmission to D or R position/mode.
    - Slowly press the accelerator pedal.

Brake Pad Maintenance Mode

When replacing the rear brake pad, it is necessary to enter the maintenance mode with the HDS.

How to Troubleshoot DTCs

The troubleshooting procedures assume that the cause of the problem is still present and the brake system indicator (amber) is still on. Following a troubleshooting procedure for a DTC that has been cleared but does not reset can result in incorrect diagnosis.

1. Question the customer about the conditions when the problem occurred, and try to reproduce the same conditions for troubleshooting. Find out when the brake system indicator (amber) came on, such as during activation, after activation, when the vehicle was traveling at a certain speed, etc. If necessary, have the customer demonstrate the concern.

2. When the brake system indicator (amber) does not come on during the test-drive, but troubleshooting is done based on the DTC, check for loose connectors, poor contact of the terminals, etc. in the circuit indicated by the DTC.

3. After troubleshooting or the repairs are done, clear the DTCs, and test-drive the vehicle under the same conditions that originally set the DTCs. Make sure the brake system indicator (amber) does not come on.

Intermittent Failures

The term "intermittent failure" means a system may have had a failure, but it checks OK now. If you cannot reproduce the condition, check for loose connections and terminals. Also check ground and power connections related to the circuit that you are troubleshooting.

How to Use the HDS (Honda Diagnostic System)

NOTE: Make sure the 12 volt battery is in good condition and fully charged.

1. If the system indicator (s) stay on, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle. If it does not, **go to the DTC troubleshooting index**

4. Check the diagnostic trouble code (DTC) and the freeze data (except ABS/VSA system), for all systems, troubleshoot the powertrain DTCs first. Then refer to the indicated DTC's troubleshooting, and do the appropriate troubleshooting procedure.

NOTE:

- The HDS can read the DTC, the freeze data (except ABS/VSA system), the current data, and other system data.
- For specific operations, refer to the Help menu that came with the HDS.

How to Retrieve DTCs

1. With the vehicle in the OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle. If it does not, **go to the DTC troubleshooting index**

4. Follow the prompts on the HDS to display the DTC (s) on the screen. After determining the DTC, refer to the DTC troubleshooting. Do the all systems DTC check, and troubleshoot any powertrain DTCs first.

5. Turn the vehicle to the OFF (LOCK) mode.

How to Clear DTCs

1. With the vehicle in the OFF (LOCK) mode, **connect the HDS to the data link connector (DLC)**

2. Turn the vehicle to the ON mode.

3. Make sure the HDS communicates with the vehicle. If it does not, **go to the DTC troubleshooting index**

4. Clear the DTC (s) by following the screen prompts on the HDS.

5. Turn the vehicle to the OFF (LOCK) mode.

TPMS DTC TROUBLESHOOTING INDEX

DTC		Detection Item
C0077	-78	Low Tire Air Pressure
C0078	-4A	Different Diameter Tire Detection

HOW TO INFORMATION

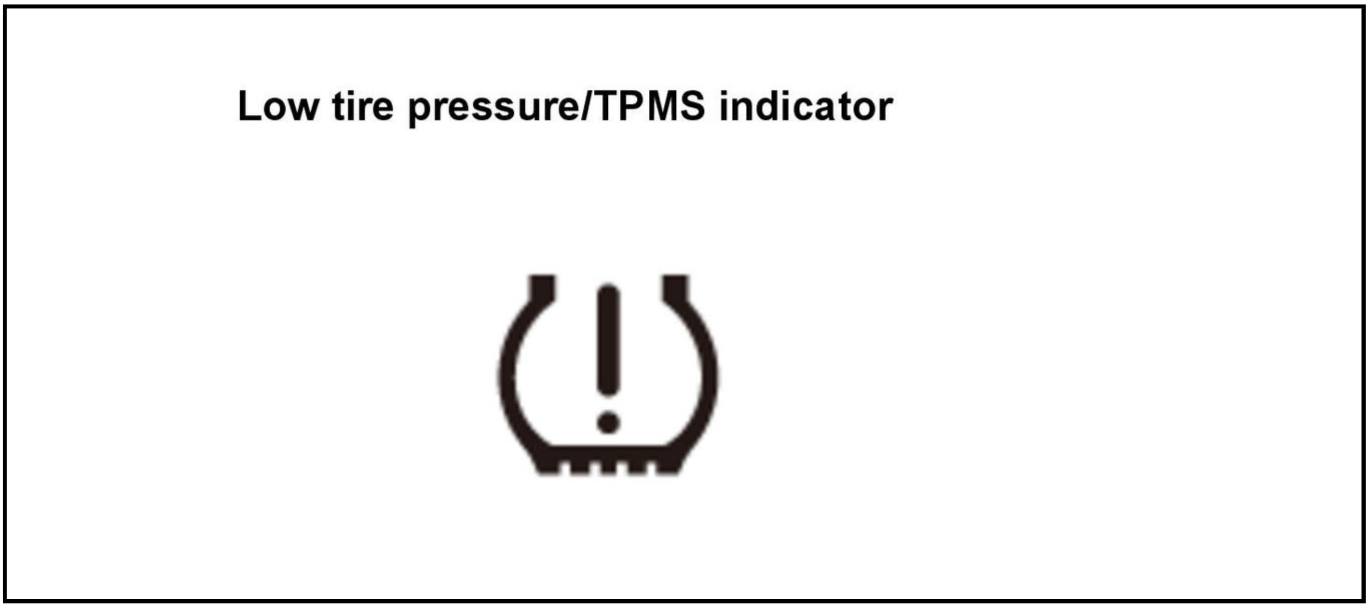
HOW TO TROUBLESHOOT THE TPMS

Control Unit

The vehicle is equipped with TPMS (tire pressure monitoring system) and the system is controlled by the VSA modulator-control unit.

System Indicator

This system has an indicator on the gauge control module.



NOTE: For locations of the indicator, refer to gauge control module component location index .

The Low Tire Pressure/TPMS Indicator

If the system detects low tire pressure in any of the four tires, the low tire pressure/TPMS indicator comes on. It will stay on until calibration procedure starts.

CHECK SYSTEM (TPMS)

- If a problem in the system is detected, the VSA indicator comes on, and the low tire pressure/TPMS indicator comes on after blinking for about 75 seconds.
- If VSA falls into error mode, TPMS also falls into error mode and stops all operation. If TPMS is calibrating, the calibration will be suspended.

If the system is OK, the low tire pressure/TPMS indicator should come on when the vehicle is turned to the ON mode, and then go off 2 seconds later. If it does not, there is a problem with the system.

Conditions for Data Rejection

Even if the system is normal, calibration or deflation detection is not performed during the following conditions.

- The brake pedal is pressed.
- The vehicle is stopping.
- While going slower than 28 mph (45 km/h) or cruising over 65 mph (105 km/h).
- Short turn, rapid acceleration, hard braking.
- Conditions where the right and left wheels are rotating at different speeds like when driving on sand, loose gravel, snow, ice or extremely rough roads.
- When the ABS, EBD, TCS, or VSA controls are operating.
- Gentle cornering radius.
- Driving on a steep slope.

Conditions Where TPMS Can Not Operate Normally

In the following cases, false warning might occur or deflation might not be detected.

- Non-recommended tires are used.
- Tires with different wear level, different brand, model, type or different sizes are used.
- All four tires are not replaced to the recommended tires at once.
- Calibrated with non-recommended tire pressure.
- Tire chains are mounted.
- Driving on sand, loose gravel, snow, ice or extremely rough roads.
- With trailer towing.
- With a roof carrier.
- With a very heavy load.
- With an extremely unbalanced load.
- Rapid deflation like a tire burst.

Change of the Tire Pressure Threshold

When changing tire/wheel size, it may be necessary to adjust the tire pressure threshold using the HDS. If it is not adjusted, the system may not operate normally. This operation can be done through ABS/VSA menu in HDS.

C0078-4A Different Diameter Tire Detection	B	B

DTC (VSA)

1. Tire and wheel check

   -1. Turn the vehicle to the OFF (LOCK) mode.

   -2. Check all four tires for size, inflation, and wear.

   Are all four tires the correct size, specified tire pressure, same speed rating, same brand/model, and are evenly worn?

   YES

   The system is OK at this time. Do the TPMS calibration .

   NO

   Install the correct tires, a known-good set of tires, or set the tires to the correct pressure, and do the TPMS calibration .

DTC C1030-11

DTC C1030-11 : TPMS Switch Circuit Short

NOTE:

- Before you troubleshoot, review the general troubleshooting information.
- Pressing and holding the TPMS switch for more than 60 seconds will cause this DTC to set.

DTC Description	DTC	Freeze Frame
C1030-11 TPMS Switch Circuit Short	B	B

DTC (VSA)

1. Problem verification

   -1. Turn the vehicle to the ON mode.

   -2. Clear the DTC with the HDS.

   -3. Turn the vehicle to the OFF (LOCK) mode, then to the ON mode.

   -4. Wait 60 seconds or more.

   -5. Check for DTCs with the HDS.

DTC Description	DTC	Freeze Frame
C1030-11 TPMS Switch Circuit Short	B	B

   Is DTC C1030-11 indicated?

   YES

   The failure is duplicated. Go to step 2.

   NO

   Intermittent failure, the system is OK at this time. If the freeze data/on-board snapshot of this DTC is recorded, try to reproduce the failure under the same conditions with the freeze data/on-board snapshot.

2. TPMS switch check

-1. Turn the vehicle to the OFF (LOCK) mode.

-2. **Check the TPMS switch** .

Is the TPMS switch OK?

YES

Go to step 3.

NO

Replace the TPMS switch .

3. Shorted wire check (TPMS SW line)

-1. Disconnect the following connectors.

Gauge control module connector A (32P)
TPMS switch 5P connector

-2. Check for continuity between test points 1 and 2.

Test condition	Vehicle OFF (LOCK) mode
B	Gauge control module connector A (32P): disconnected
B	TPMS switch 5P connector: disconnected
Test point 1	**Gauge control module connector A (32P) No. 23**
Test point 2	Body ground

Is there continuity?

YES

Repair a short to body ground in the wire between the gauge control module and the TPMS switch.

NO

The TPMS SW wire is OK. Check for any authorized service information related to the DTCs or symptoms you are troubleshooting or **substitute a known-good gauge control module** , then recheck. If the symptom/indication goes away with a known-good gauge control module, **replace the original gauge control module** .

HOW TO INFORMATION

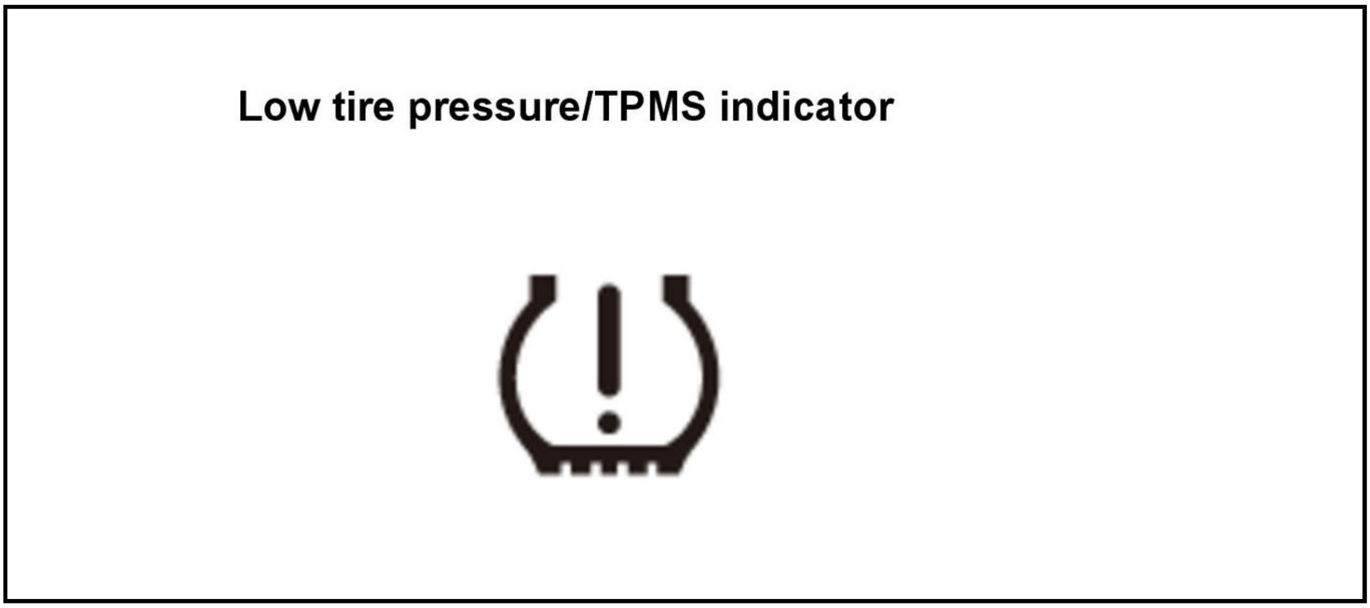
HOW TO TROUBLESHOOT THE TPMS

Control Unit

The vehicle is equipped with TPMS (tire pressure monitoring system) and the system is controlled by the VSA modulator-control unit.

System Indicator

This system has an indicator on the gauge control module.



NOTE: For locations of the indicator, refer to gauge control module component location index .

The Low Tire Pressure/TPMS Indicator

If the system detects low tire pressure in any of the four tires, the low tire pressure/TPMS indicator comes on. It will stay on until calibration procedure starts.

CHECK SYSTEM (TPMS)

- If a problem in the system is detected, the VSA indicator comes on, and the low tire pressure/TPMS indicator comes on after blinking for about 75 seconds.
- If VSA falls into error mode, TPMS also falls into error mode and stops all operation. If TPMS is calibrating, the calibration will be suspended.

If the system is OK, the low tire pressure/TPMS indicator should come on when the vehicle is turned to the ON mode, and then go off 2 seconds later. If it does not, there is a problem with the system.

Conditions for Data Rejection

Even if the system is normal, calibration or deflation detection is not performed during the following conditions.

- The brake pedal is pressed.
- The vehicle is stopping.
- While going slower than 28 mph (45 km/h) or cruising over 65 mph (105 km/h).
- Short turn, rapid acceleration, hard braking.
- Conditions where the right and left wheels are rotating at different speeds like when driving on sand, loose gravel, snow, ice or extremely rough roads.
- When the ABS, EBD, TCS, or VSA controls are operating.
- Gentle cornering radius.
- Driving on a steep slope.

Conditions Where TPMS Can Not Operate Normally

In the following cases, false warning might occur or deflation might not be detected.

- Non-recommended tires are used.
- Tires with different wear level, different brand, model, type or different sizes are used.
- All four tires are not replaced to the recommended tires at once.

- Calibrated with non-recommended tire pressure.
- Temporary spare tires or tire chains are mounted.
- Driving on sand, loose gravel, snow, ice or extremely rough roads.
- With trailer towing.
- With a roof carrier.
- With a very heavy load.
- With an extremely unbalanced load.
- Rapid deflation like a tire burst.

Change of the Tire Pressure Threshold

When changing tire/wheel size, it may be necessary to adjust the tire pressure threshold using the HDS. If it is not adjusted, the system may not operate normally. This operation can be done through the ABS/TCS/VSA menu in HDS.

ADVANCED DIAGNOSTICS

DTC B0050-F0 (VSA CONTROL UNIT)

DTC B0050-F0 : (Driver's Seat Belt Buckle Switch Malfunction)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• SRS failure

DTC C0010-49

DTC C0010-49 : Inlet Solenoid (Left Front) Circuit Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • ABS/VSA function not in operation With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Wait 20 seconds or more.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• VSA modulator-control unit internal failure

DTC C0011-49

DTC C0011-49 : Outlet Solenoid (Left Front) Circuit Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• VSA modulator-control unit internal failure

DTC C0014-49

DTC C0014-49 : Inlet Solenoid (Right Front) Circuit Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Degrade EBD performance • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Open or poor connection between the VSA modulator-control unit and body ground (GND line) • VSA modulator-control unit internal failure

DTC C0020-14

DTC C0020-14 : Pump Motor Circuit Failure (Stuck OFF)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • ABS/VSA function not in operation With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 20 seconds or more.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Degrade EBD performance • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Open or short to ground between the VSA modulator-control unit and the under-hood fuse/relay box (+B_ABS/VSA_MTR line) • Fuse failure (Under-hood fuse/relay box No. A3-3) • VSA modulator-control unit internal failure

DTC C0031-14

DTC C0031-14 : Left Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Open, short to ground, short to power, or short to another line between the VSA modulator-control unit and the left-front wheel speed sensor (FR_L_ABS_SNSR+, FR_L_ABS_SNSR- lines) • Left- front wheel speed sensor failure • VSA modulator-control unit internal failure

DTC C0031-3A

DTC C0031-3A : Wheel Speed Sensor (Left Front) Signal Failure (Signal Frequency is Too High)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle for 80 seconds or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 80 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Electrical noise in the left-front wheel speed sensor signal • Left-front wheel speed sensor incorrect installation • Debris on the left-front encoder surface • Left-front wheel speed sensor failure • VSA modulator-control unit internal failure

DTC C0031-62 (VSA CONTROL UNIT)

DTC C0031-62 : Left Front Wheel Speed Sensor Signal Compare Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • No other DTCs detected • Brake TCS function not in operation • ABS function not in operation (Not applied under operating only for slowest wheel) With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at 31 mph (50 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Left-front wheel speed sensor incorrect installation • Debris on the left-front encoder surface • Left-front wheel speed sensor failure • VSA modulator-control unit internal failure

DTC C0034-14

DTC C0034-14 : Right Front Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Right-front wheel speed sensor incorrect installation • Debris on the right-front encoder surface • Right-front wheel speed sensor failure • VSA modulator-control unit internal failure

DTC C0037-14 : Left Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (red) on (If multiple wheel failures are detected) - Brake system indicator (amber) on - ABS indicator on - VSA indicator on
Fail Safe Action	- Stop EBD function (If multiple wheel failures are detected) - Stop ABS function - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop hydraulic boost failure compensation function - Stop electric parking brake function (some of function)
Possible Cause	- Open, short to ground, short to power, or short to another line between the VSA modulator-control unit and the left-rear wheel speed sensor (RR_L_ABS_SNSR+, RR_L_ABS_SNSR- lines) - Left-rear wheel speed sensor failure - VSA modulator-control unit internal failure

DTC C0037-3A

DTC C0037-3A : Wheel Speed Sensor (Left Rear) Signal Failure (Signal Frequency is Too High)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle for 80 seconds or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 80 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Electrical noise in the left-rear wheel speed sensor signal • Left-rear wheel speed sensor incorrect installation • Debris on the left-rear encoder surface • Left-rear wheel speed sensor failure • VSA modulator-control unit internal failure

DTC C0037-62 (VSA CONTROL UNIT)

DTC C0037-62 : Left Rear Wheel Speed Sensor Signal Compare Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition • No other DTCs detected • Brake TCS function not in operation • ABS function not in operation (Not applied under operating only for slowest wheel) With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at 31 mph (50 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function

	- Stop electric parking brake function (some of function)
Possible Cause	- Left-rear wheel speed sensor incorrect installation - Debris on the left-rear encoder surface - Left-rear wheel speed sensor failure - VSA modulator-control unit internal failure

DTC C003A-14

DTC C003A-14 : Right Rear Wheel Speed Sensor Circuit Failure (Circuit Short To Ground or Open)

NOTE

- Initial Diagnosis:

DTC C0040-12

DTC C0040-12 : Brake Light Switch Failure (Stuck ON)/Brake Pedal Stroke Sensor Stuck (EBB)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle under these conditions: (Be careful of the surrounding traffic conditions.) • ◦ Vehicle speed at 9 mph (15 km/h) or more for at least 60 seconds ◦ Accelerator pedal pressed ◦ Brake pedal released
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Degrade hydraulic boost failure compensation function
Possible Cause	• Short to power between the brake pedal position switch and the PCM (STOP_SW line) • Brake pedal height incorrect position • Brake pedal position switch failure • PCM internal failure • VSA modulator-control unit internal failure

DTC C0040-16

DTC C0040-16 : Plausibility BLS vs. Pressure Sensor

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Wait 1 second or more without pressing the brake pedal. • Press the brake pedal hard for 1 second or more.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Degrade hydraulic boost failure compensation function
Possible Cause	• Brake pedal height incorrect position • Open or short to ground between the under-hood fuse/relay box and the brake pedal position switch (+B_STOP line) • Open or short to ground between the brake pedal position switch and the PCM (STOP_SW line) • Fuse failure (Under-hood fuse/relay box No. A9) • Brake pedal position switch failure • PCM internal failure • VSA modulator-control unit internal failure

DTC C0044-49

DTC C0044-49 : Master Cylinder Pressure Sensor Failure (Internal Circuit Failure)

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• VSA modulator-control unit internal failure

DTC C0044-62

DTC C0044-62 : Master Cylinder Pressure Sensor Failure (Signal Stuck)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • ABS/VSA function not in operation • Vehicle is not braking With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle under these conditions: (Be careful of the surrounding traffic conditions.) • • Vehicle speed at less than 9 mph (14 km/h) for at least 30 seconds • Brake pedal released
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• VSA modulator-control unit internal failure

DTC C0049-7B

DTC C0049-7B : Brake Fluid Level Too Low

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the ON mode. • Wait 60 seconds or more.
Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Short to ground between the gauge control module and the brake fluid level switch (BRAKE_LEVEL_SW line) • Low brake fluid level • Brake fluid level switch failure • Gauge control module internal failure • VSA modulator-control unit internal failure

DTC C0051-54 (VSA CONTROL UNIT)

DTC C0051-54 : Steering Angle Neutral Position Learning Incomplete

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• Steering angle neutral position not learned • EPS motor/control unit internal failure • VSA modulator-control unit internal failure

DTC C0051-62

DTC C0051-62 : Steering Angle Sensor Failure (Signal Compare Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:

	• 12 volt battery voltage 9.6 - 16.5 V
	• No other DTCs detected
	With the Driving Pattern:
	• Turn the vehicle to the READY TO DRIVE mode.
	• Test-drive the vehicle under these conditions:
	(Be careful of the surrounding traffic conditions.)
	•
	  • Vehicle speed at 45 mph (72 km/h) or more
	  • Change lanes for a few times

Execution	Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• EPS motor/control unit internal failure • VSA modulator-control unit internal failure

DTC C0051-96 (VSA CONTROL UNIT)

DTC C0051-96 : Steering Angle Sensor Failure (Sensor Detects Internal Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V

	- No other DTCs detected With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode. - Turn the steering wheel left and right for a few times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - VSA indicator on
Fail Safe Action	- Degrade ABS performance - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function
Possible Cause	- EPS motor/control unit internal failure - VSA modulator-control unit internal failure

DTC C0061-49

DTC C0061-49 : Acceleration Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - VSA indicator on
Fail Safe Action	- Degrade ABS performance

	• Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• SRS unit internal failure

DTC C0061-54

DTC C0061-54 : Lateral Acceleration Sensor Calibration Incomplete

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• VSA sensor neutral position memorization not completed • SRS unit internal failure • VSA modulator-control unit internal failure

DTC C0061-62

DTC C0061-62 : Lateral Acceleration Sensor Failure (Signal Compare Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle under these conditions: (Be careful of the surrounding traffic conditions.) •

	• Vehicle speed at 31 mph (50 km/h) or more for at least 20 seconds • Change lanes for a few times
Execution	Regular Diagnosis
Duration	About 2 seconds
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• SRS unit internal failure

DTC C0062-49

DTC C0062-49 : Longitudinal Acceleration Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop ABS function • Stop engine drag torque control function

	• Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• SRS unit internal failure

DTC C0062-54

DTC C0062-54 : Longitudinal Acceleration Sensor Neutral Position Not Learned/Calibration Incomplete

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function

	- Stop electric parking brake function (some of function)
Possible Cause	- VSA sensor neutral position memorization not completed - SRS unit internal failure - VSA modulator-control unit internal failure

DTC C0062-62

DTC C0062-62 : Longitudinal Acceleration Sensor Failure (Signal Compare Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition:
	- No other DTCs detected
	- ABS/VSA function not in operation
	With the Driving Pattern:
	- Turn the vehicle to the READY TO DRIVE mode.
	- Test-drive the vehicle under these conditions:
	(Be careful of the surrounding traffic conditions.)
	-
	  - Vehicle speed at 31 mph (50 km/h) or more for at least 20 seconds
	  - Brake pedal released
	  - Change lanes for a few times

Execution	Regular Diagnosis
Duration	About 20 seconds
DTC Type	- 1 drive cycle - Brake system indicator (amber) on - ABS indicator on - VSA indicator on
Fail Safe Action	- Stop ABS function

	- Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop hydraulic boost failure compensation function - Stop electric parking brake function (some of function)
Possible Cause	- SRS unit internal failure

DTC C0063-49

DTC C0063-49 : Yaw Rate Sensor Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on (Dependant upon the conditions) - ABS indicator on (Dependant upon the conditions) - VSA indicator on
Fail Safe Action	- Stop ABS function or degrade ABS performance (Dependant upon the conditions) - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop hydraulic boost failure compensation function (Dependant upon the conditions) - Stop electric parking brake function (some of function) (Dependant upon the conditions)
Possible Cause	- SRS unit internal failure

DTC C0063-54

DTC C0063-54 : Yaw Rate Sensor Calibration Incomplete

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: - 12 volt battery voltage 9.6 - 16.5 V - No other DTCs detected With the Driving Pattern:

	• Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• VSA sensor neutral position memorization not completed • SRS unit internal failure • VSA modulator-control unit internal failure

DTC C0063-62

DTC C0063-62 : Yaw Rate Sensor Failure (Signal Compare Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • No other DTCs detected • ABS/VSA function not in operation With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle under these conditions: (Be careful of the surrounding traffic conditions.) • • Vehicle speed at 31 mph (50 km/h) or more for at least 20 seconds

	• Brake pedal released • Change lanes for a few times
Execution	Regular Diagnosis
Duration	About 5 seconds
DTC Type	• 1 drive cycle • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function
Possible Cause	• SRS unit internal failure

DTC C1000-94

DTC C1000-94 : ABS/VSA Activation Time Too Long

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 6.9 V or more With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle under these conditions: (Be careful of the surrounding traffic conditions.) • • Vehicle speed at 31 mph (50 km/h) or more for at least 60 seconds • Brake pedal released

Execution	Regular Diagnosis
Duration	About 60 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (Dependant upon the conditions) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (Dependant upon the conditions) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Low air pressure in tires • Different diameter tires • Wheel speed sensor failure • Debris on the encoder surface • VSA modulator-control unit internal failure

DTC C1020-49

DTC C1020-49 : VSA Master Cut Valve Failure (Unexpected Operation)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.

	• Wait 20 seconds or more. • Test-drive the vehicle at 9 mph (15 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 20 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• VSA modulator-control unit internal failure

DTC C1021-49

DTC C1021-49 : VSA Suction Valve Failure (Unexpected Operation)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.

	Wait 20 seconds or more. Test-drive the vehicle at 9 mph (15 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 20 seconds
DTC Type	1 drive cycle Brake system indicator (red) on Brake system indicator (amber) on ABS indicator on VSA indicator on
Fail Safe Action	Stop EBD function Stop ABS function Stop engine drag torque control function Stop TCS function Stop VSA function Stop agile handling assist function Stop hydraulic boost failure compensation function Stop electric parking brake function (some of function)
Possible Cause	VSA modulator-control unit internal failure

DTC C1022-14

DTC C1022-14 : Power Source Failure for Pump Motor

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at 6 mph (10 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) on • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Degrade EBD performance • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Open or short to ground between the VSA modulator-control unit and the under-hood fuse/relay box (+B_ABS/VSA_MTR line) • Fuse failure (Under-hood fuse/relay box No. A3-3) • VSA modulator-control unit internal failure

DTC C1040-00 (VSA CONTROL UNIT)

DTC C1040-00 : Different Diameter Tire is Detected

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 72 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (Dependant upon the conditions) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (Dependant upon the conditions) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist control function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Low air pressure in tires • Different diameter tires • Wheel speed sensor failure • Debris on the encoder surface • VSA modulator-control unit internal failure

DTC C1041-00

DTC C1041-00 : Right Front Wheel Abnormal Slip Detection

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 72 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Low air pressure in right-front tire • Different diameter right-front tire • Right-front wheel speed sensor failure • Debris on the right-front encoder surface • VSA modulator-control unit internal failure

DTC C1042-00

DTC C1042-00 : Left Front Wheel Abnormal Slip Detection

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

Possible Cause	• Low air pressure in left-front tire • Different diameter left-front tire • Left-front wheel speed sensor failure • Debris on the left-front encoder surface • VSA modulator-control unit internal failure

DTC C1043-00

DTC C1043-00 : Right Rear Wheel Abnormal Slip Detection

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Low air pressure in right-rear tire • Different diameter right-rear tire • Right-rear wheel speed sensor failure • Debris on the right-rear encoder surface • VSA modulator-control unit internal failure

DTC C1044-00

DTC C1044-00 : Left Rear Wheel Abnormal Slip Detection

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • No other DTCs detected With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode. • Test-drive the vehicle at 12 mph (20 km/h) or more for at least 72 seconds. (Be careful of the surrounding traffic conditions.)
Execution	Regular Diagnosis
Duration	About 72 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) on (If multiple wheel failures are detected) • Brake system indicator (amber) on • ABS indicator on • VSA indicator on
Fail Safe Action	• Stop EBD function (If multiple wheel failures are detected) • Stop ABS function • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Stop hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Low air pressure in left-rear tire • Different diameter left-rear tire • Left-rear wheel speed sensor failure • Debris on the left-rear encoder surface • VSA modulator-control unit internal failure

DTC C1100-48

DTC C1100-48 : Electric Parking Brake Abnormal Operation Monitoring

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • Wheel speed is less than 2 mph (3 km/h) With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times. • Wait 30 seconds or more.
Execution	Regular Diagnosis
Duration	About 30 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) blink • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• VSA modulator-control unit internal failure

DTC C1100-54

DTC C1100-54 : Piston Position Not Learned

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode.
Execution	Regular Diagnosis
Duration	-
DTC Type	• 1 drive cycle • Brake system indicator (red) on
Fail Safe Action	• None
Possible Cause	• Piston position not learned • VSA modulator-control unit internal failure

DTC C1100-94

DTC C1100-94 : Electric Parking Brake Actuator Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) blink

	- Brake system indicator (amber) on
Fail Safe Action	- Stop electric parking brake function (some of function)
Possible Cause	- Electric parking brake actuator internal failure - VSA modulator-control unit internal failure

DTC C1100-98

DTC C1100-98 : Electric Parking Brake Continuous Operations Detected

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode. - Apply and release the parking brake several times. (This DTC is set when repeated use of the electric parking brake function causes electric parking brake actuator overheating.)
Execution	Regular Diagnosis
Duration	-
DTC Type	- 1 drive cycle - Brake system indicator (amber) on
Fail Safe Action	- Stop electric parking brake function (some of function)
Possible Cause	- Electric parking actuator overheating - VSA modulator-control unit internal failure

DTC C1110-11

DTC C1110-11 : Left Rear Electric Parking Brake Actuator Circuit Short to Ground

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• Short to ground between the VSA modulator-control unit and the left-rear electric parking brake actuator (EPB_L_ACT+, EPB_L_ACT- lines) • Left-rear electric parking brake actuator • VSA modulator-control unit internal failure

DTC C1110-13

DTC C1110-13 : Left Rear Electric Parking Brake Actuator Circuit Open

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern:

	- Turn the vehicle to the ON mode. - Apply and release the parking brake several times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (amber) on
Fail Safe Action	- Stop electric parking brake function (some of function)
Possible Cause	- Open or poor connection between the VSA modulator-control unit and the left-rear electric parking brake actuator (EPB_L_ACT+, EPB_L_ACT- lines) - Open, short to ground, or poor connection between the VSA modulator-control unit and the under-hood fuse/relay box (+B_ABS/VSA_FSR line) - Fuse failure (Under-hood fuse/relay box No. A1-3) - Left-rear electric parking brake actuator - VSA modulator-control unit internal failure

DTC C1110-79

DTC C1110-79 : Left Side Electric Parking Brake Doesn't Work Correctly

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode. - Apply and release the parking brake several times. - Wait 35 seconds or more.
Execution	Regular Diagnosis
Duration	About 35 seconds
DTC Type	- 1 drive cycle - Brake system indicator (red) blink - Brake system indicator (amber) on

Fail Safe Action	- Stop electric parking brake function (some of function)
Possible Cause	- Rear brake component parts installation incorrect - Left-rear electric parking brake actuator - VSA modulator-control unit internal failure

DTC C1110-94

DTC C1110-94 : Left Side Electric Parking Brake Actuator Unexpected Operation

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the ON mode. - Apply and release the parking brake several times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (red) blink - Brake system indicator (amber) on
Fail Safe Action	- Stop electric parking brake function (some of function)
Possible Cause	- Left-rear electric parking brake actuator - VSA modulator-control unit internal failure

DTC C1110-96

DTC C1110-96 : Left Side Electric Parking Brake Actuator Malfunction

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) blink (Dependant upon the conditions) • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• Rear brake component parts installation incorrect • Left-rear electric parking brake actuator • VSA modulator-control unit internal failure

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• Open or poor connection between the VSA modulator-control unit and the right-rear electric parking brake actuator (EPB_R_ACT+, EPB_R_ACT- lines)

	• Open, short to ground, or poor connection between the VSA modulator-control unit and the under-hood fuse/relay box (+B_ABS/VSA_FSR line) • Fuse failure (Under-hood fuse/relay box No. A1-3) • Right-rear electric parking brake actuator • VSA modulator-control unit internal failure

DTC C1111-79

DTC C1111-79 : Right Side Electric Parking Brake Doesn't Work Correctly

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times. • Wait 35 seconds or more.
Execution	Regular Diagnosis
Duration	About 35 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) blink • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• Rear brake component parts installation incorrect • Right-rear electric parking brake actuator • VSA modulator-control unit internal failure

DTC C1111-94

DTC C1111-94 : Right Side Electric Parking Brake Actuator Unexpected Operation

Confirmation Procedure	With the Driving Pattern: • Turn the vehicle to the ON mode. • Apply and release the parking brake several times.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	• 1 drive cycle • Brake system indicator (red) blink (Dependant upon the conditions) • Brake system indicator (amber) on
Fail Safe Action	• Stop electric parking brake function (some of function)
Possible Cause	• Rear brake component parts installation incorrect • Right-rear electric parking brake actuator • VSA modulator-control unit internal failure

DTC C1120-14

DTC C1120-14 : Electric Parking Brake Switch Circuit Malfunction

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

0 V
U
V
W
High voltage
DC-DC CONVERTER
12 VOLT BATTERY
DC-DC converter output

PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) controls the voltage at which to charge a 12 volt battery according to the input from the VBU terminal voltage. If the VBU terminal voltage is out of a specified value for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	5.5 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
IGA voltage	10 V	-
Vehicle	ON mode	

Malfunction Threshold

The VBU terminal voltage of the motor control module is less than 3.0 V for at least 5.5 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- This DTC is stored at the same time when DTC P0AE1, P0DA8 or P1D65 is detected.
- DC-DC converter internal circuit failure
- PCU internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the motor control module memory.

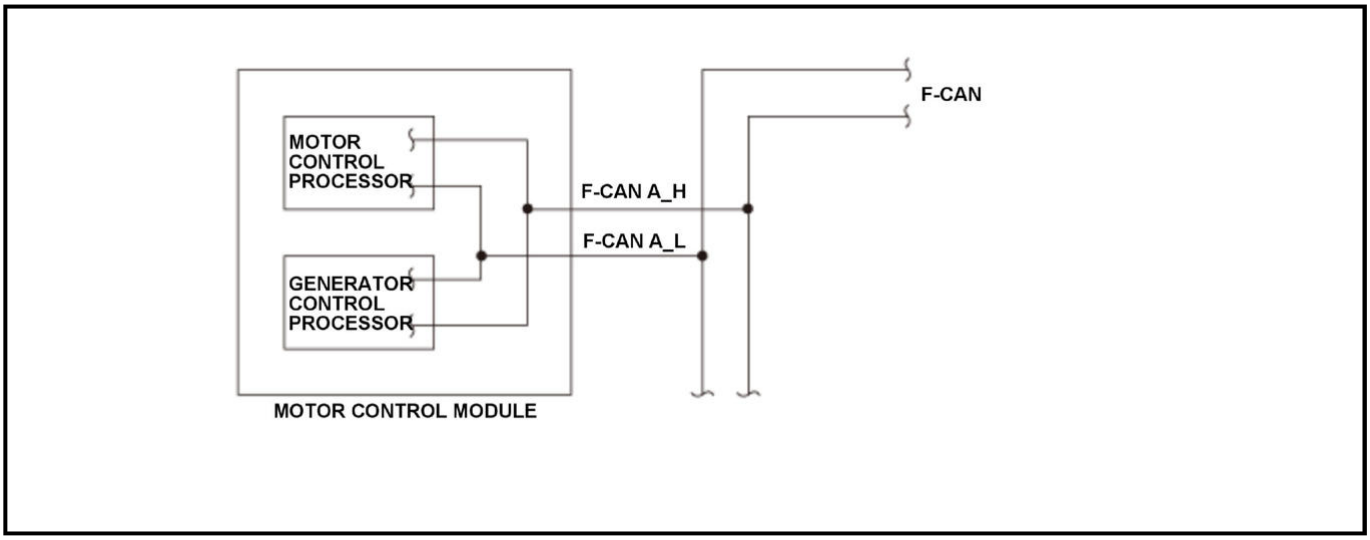
Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC P0602 (GENERATOR MOTOR CONTROL MODULE)

DTC P0602: Generator Motor Control Module Programming Error

General Description



The generator control processor in the motor control module can be reprogrammed with updated software. The generator control processor confirms if the control program update is completed normally. When the power is interrupted during reprogramming, the generator control processor detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

DTC P061B (MOTOR CONTROL MODULE)

DTC P061B: Traction Motor Control Module Torque Calculation Performance

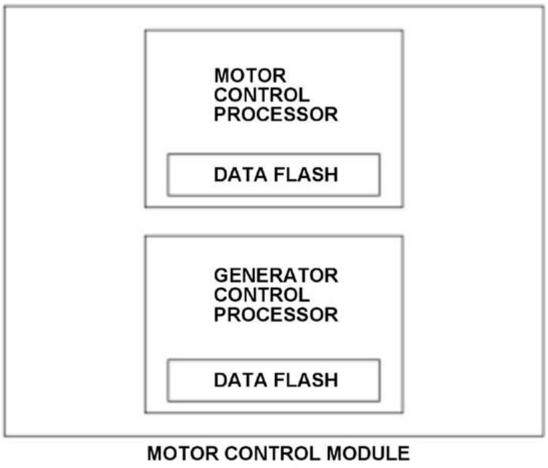
General Description

This fault code is a general (specified by SAE) DTC that is stored at the time the following DTC codes (P1A54, P1A55) are detected.

DTC P062F (GENERATOR MOTOR CONTROL MODULE)

DTC P062F: Generator Motor Control Module EEPROM Error

General Description



The generator control processor in the motor control module store control data to the data flash in the generator control processor. The generator control processor compares the input data and read data of the data flash. When the data does not match, a malfunction is detected and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

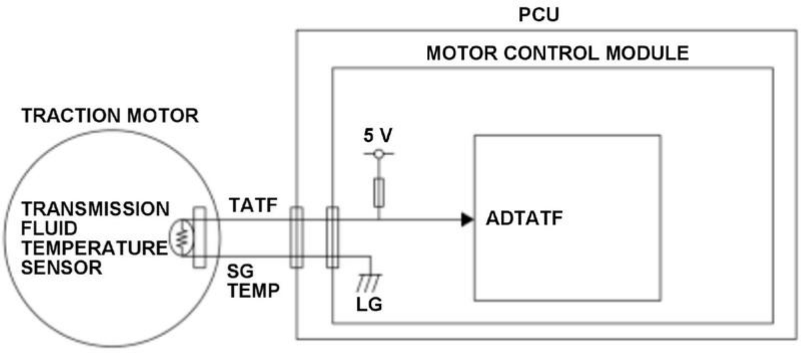
DTC P0710

DTC P0710: Transmission Fluid Temperature Sensor Circuit Range/Performance

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The traction motor is cooled by an automatic transmission fluid (ATF)-based oil cooling system and the power control unit (PCU) obtains the ATF temperature and traction motor temperature signals. Normally, the traction motor temperature and the ATF temperature become nearly the same value immediately after the traction motor is started when it is sufficiently cooled down. The motor control module in the PCU detects a malfunction and stores a DTC when the difference between the ATF temperature and the traction motor temperature immediately after the motor is started is equal to or more than the prescribed value continuously for the prescribed time or more.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	3 seconds or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the OFF (LOCK) mode	5 hours 50 minutes	-

Condition	Minimum	Maximum
Traction motor absolute torque value	-	10 N*m (1 kgf*m, 7.3 Ibf*ft)

Malfunction Threshold

The difference between the ATF temperature [ATF Temperature (TRC)] and the traction motor temperature is more than 90 deg.F (50 deg.C) for at least 3 seconds.

- PCU internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the motor control module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

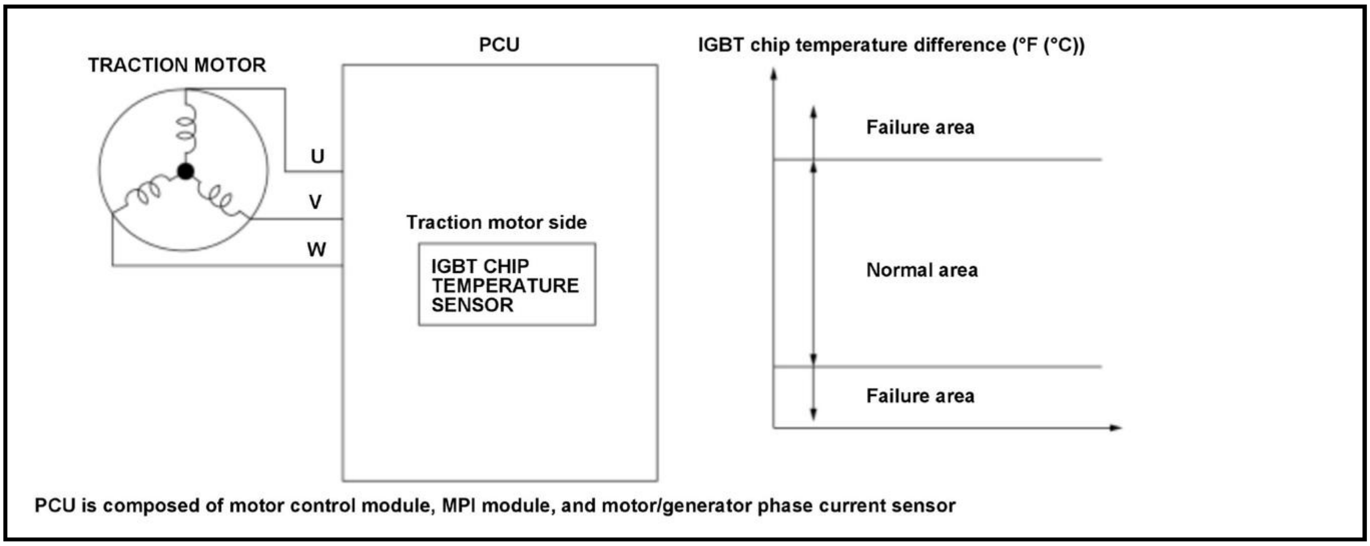
DTC P0AED

DTC P0AED: Traction Motor Inverter Temperature Sensor 1 Circuit

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) monitors the IGBT chip temperature sensor values to prevent malfunctions of the chip and other parts due to heat generation. The PCU calculates the difference in output temperature between the parallel phases of the IGBT chip temperature sensor at the traction motor side. If the difference is out of a specified value for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Failure area
PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) monitors the IGBT chip and board temperature sensor values to prevent malfunctions of the chip and other parts due to heat generation. The motor control module in the PCU compares the output temperature difference between the IGBT chip temperature sensor and the board temperature sensor at system activation timing, and if the difference exceeds a malfunction threshold for a specified time, the motor control module detects a malfunction and stores a DTC.

Malfunction Threshold

The output temperature difference between the IGBT chip temperature sensor and the board temperature sensor at system activation timing is more than 84 deg.F (47 deg.C) or less than -83 deg.F (-46 deg.C) for at least 100 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCU internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the motor control module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

General Description

To control the temperature of power control unit (PCU) coolant, while monitoring the coolant temperature and the temperature of each part, the PCU drives the PCU electric coolant pump and sends a drive request to the radiator fan. Since the coolant temperature and the reactor temperature become nearly identical immediately after the engine is started when it is sufficiently cooled down, the motor control module in the PCU detects a malfunction and stores a DTC when the difference between the coolant temperature and the reactor temperature is equal to or more than the prescribed value continuously for the prescribed time or more.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the motor control module memory. If the malfunction returns in the next (second) drive cycle, the POWER SYSTEM indicator comes on and a Confirmed DTC and the freeze data are stored. The MIL does not come on.

Conditions for clearing the DTC

The POWER SYSTEM indicator is cleared if the malfunction does not return in the next trip in which the diagnostic runs. The POWER SYSTEM indicator, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

Symptom 1

When an overcurrent (short circuit current) passes through the IGBT at the traction motor side, the power control unit (PCU) detects a trouble (SC) with the GDIC function and, at the same time when outputting a failure information (SC) to the main microcomputer, blocks a gate signal. The failure information (SC) from the GDIC is released after a specified time has elapsed if the failure is restored to normal. If a specified number of SC signals are issued, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 2

When a trouble with the power supply which drives the IGBT at the traction motor side occurs, the PCU detects a trouble (F15V) with the GDIC function and, at the same time when outputting a failure information (F15V) to the main microcomputer, blocks a gate signal. If an F15V signal and CAN information (TRC FO) from the high-voltage microcomputer are detected for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) cannot be able to output malfunction information (SC) signal which outputs by an occurrence of IGBT overcurrent if the SC detection circuit malfunctions. Three motor phase current typically generate sine waves centered around 0 A. But if it malfunctions, a part of the waveform chips or one phase fixes to 0 A resulting an occurrence of difference between the commanded current and the actual current. If either of the following conditions occurs, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 1

If the 3-phase current sensor output value is out of a specified value for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 2

If the deviation between the current sensor output (A) and command value is out of a specified value in specified times, the motor control module in the PCU detects a malfunction and stores a DTC.

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the motor control module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

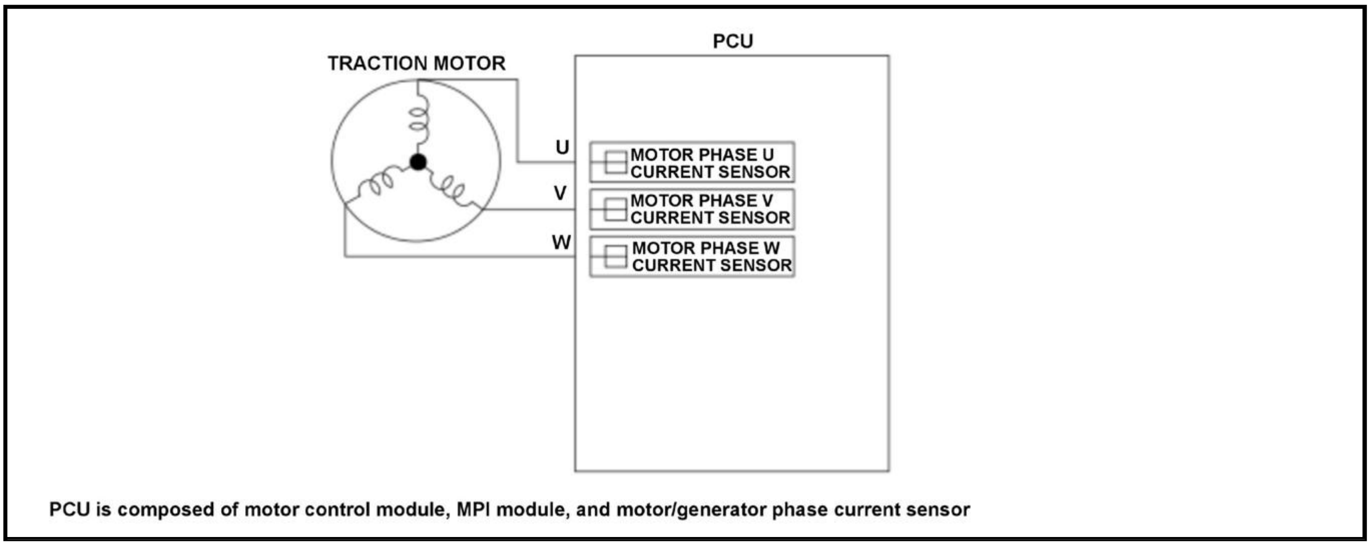
DTC P1A55: Traction Motor Control Module Torque Adjustment Performance

General Description



PCU
TRACTION MOTOR
U
V
W
MOTOR PHASE U CURRENT SENSOR
MOTOR PHASE V CURRENT SENSOR
MOTOR PHASE W CURRENT SENSOR
PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) controls the motor output based on the motor phase current sensor signals. When the motor control module in the PCU malfunctions, there is a possibility that the motor torque cannot be controlled properly. If the difference between the commanded motor torque and the target motor torque is out of a specified value, the motor control module detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

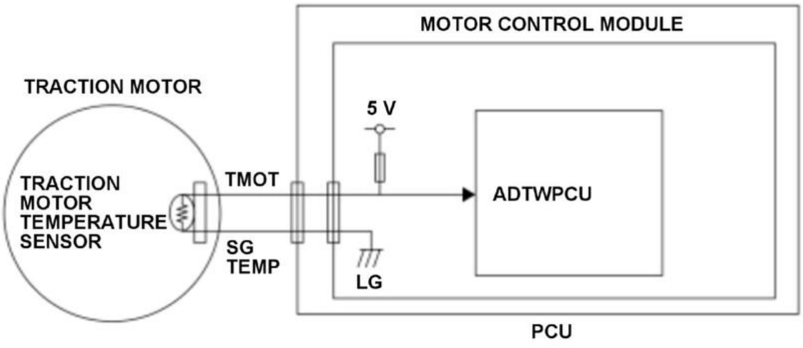
DTC P1D6E

DTC P1D6E: Traction Motor Temperature Sensor Circuit Performance

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The traction motor is cooled by an automatic transmission fluid (ATF)-based oil cooling system and the motor control module obtains the ATF temperature and traction motor temperature signals. Normally, the traction motor temperature and the ATF temperature become nearly the same value immediately after the traction motor is started when it is sufficiently cooled down. The motor control module in the power control unit (PCU) detects a malfunction and stores a DTC when the difference between the ATF temperature and the traction motor temperature immediately after the motor is started is equal to or more than the prescribed value for the prescribed time or more.

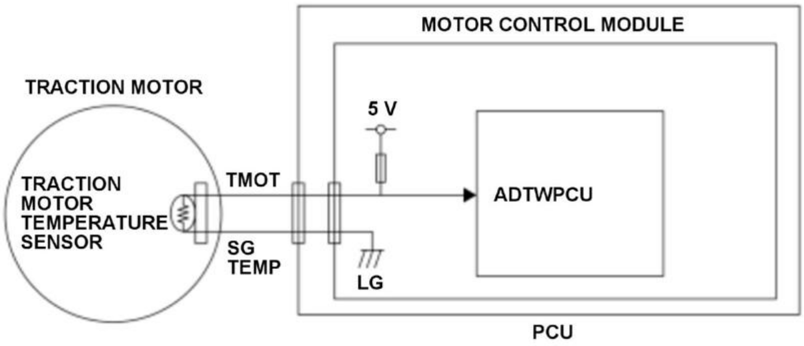
DTC P1D72

DTC P1D72: Traction Motor Temperature Sensor Circuit Range/Performance (Lo Side)

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) detects the traction motor temperature with a traction motor temperature sensor installed in the traction motor. The motor control module in the PCU detects a malfunction and stores a DTC when the traction motor temperature sensor value does not change from the initial value continuously for the prescribed time though the traction motor is under load.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None

DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Traction motor absolute torque value	260 N.m (26.6 kgf.m, 191.8 lbf.ft)	-

Malfunction Threshold

When the deviation between the temperature sensor value while the traction motor is operating under high duty and the initial temperature sensor value at the start is 1 deg.F (1 deg.C) or less continuously for 8 seconds or more.

Possible Cause

PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) cannot be able to output malfunction information (SC) signal which outputs by an occurrence of IGBT overcurrent if the SC detection circuit malfunctions. Three motor phase current typically generate sine waves centered around 0 A. But if it malfunctions, a part of the waveform chips or one phase fixes to 0 A resulting an occurrence of difference between the commanded current and the actual current. If either of the following conditions occurs, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 1

If the 3-phase current sensor output value is out of a specified value for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 2

Symptom 1

When an overcurrent (short circuit current) passes through the IGBT at the generator motor side, the power control unit (PCU) detects a trouble (SC) with the GDIC function and, at the same time when outputting a failure information (SC) to the main microcomputer, blocks a gate signal. The failure information (SC) from the GDIC is released after a specified time has elapsed if the failure is restored to normal. If a specified number of SC signals are issued, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 2

When a trouble with the power supply which drives the IGBT at the generator motor side occurs, the PCU detects a trouble (F15V) with the GDIC function and, at the same time when outputting a failure information (F15V) to the main microcomputer, blocks a gate signal. - If an SC detection arising from IGBT overcurrent (short circuit current) occurs three times consecutively.

Symptom 2

- If an F15V detection (F15V detection and CAN information (TRC FO) from the high-voltage microcomputer) arising from a trouble with the power supply which drives the IGBT occurs continuously for at least 120 milliseconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCU internal failure

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the motor control module memory.

Conditions for clearing the DTC

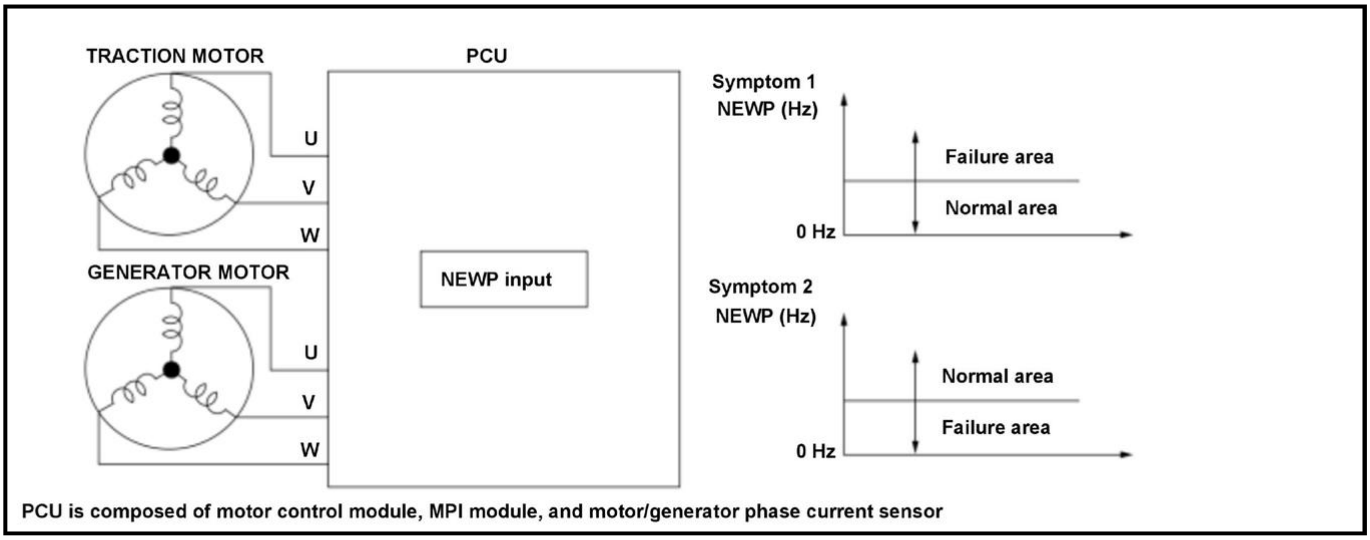
The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear

command.

DTC P1D92

DTC P1D92: PCU Electric Coolant Pump Control Circuit

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) controls the PCU electric coolant pump according to the rotational speed of the PCU electric coolant pump calculated from the frequency (duty fixed to 50 %) detected from the NEWP terminal. If either of the following conditions occurs, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 1

If the NEWP output equivalent to "85 % duty" output when the EWP detects an open / short to power of the EWP wire or a trouble with EWP input duty waveform (continuous Hi signal) is out of a specified value for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 2

If the NEWP output which is output when a short circuit of the EWP wire or a trouble with EWP input duty waveform (abnormal interval) is out of a specified value for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

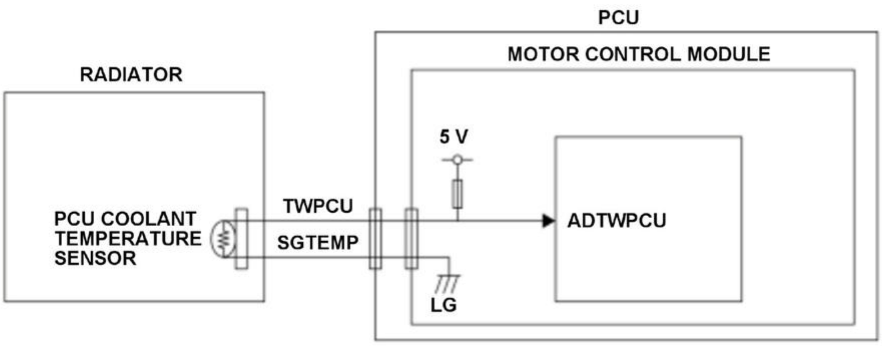
DTC P1D93

DTC P1D93: PCU Coolant Over Temperature

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

To control the temperature of power control unit (PCU) coolant, while monitoring the coolant temperature and the temperature of each part, the PCU drives the PCU electric coolant pump and sends a drive request to the radiator fan control (RFC) unit. If the coolant temperature is extraordinarily high although the PCU provides the PCU electric coolant pump and RFC unit with an adequate command, the PCU detects a malfunction and stores a DTC.

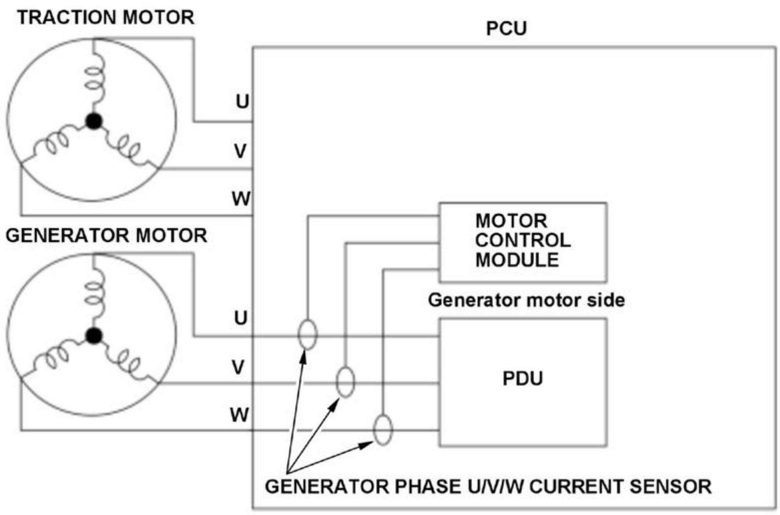
DTC P1D97

DTC P1D97: Generator Motor Phase Current Sensors Multiple Failure

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) controls the generator motor output based on the generator phase current sensor signals. If a failure in the current sensor or sensor power supply is detected in two phases or more, it is determined more than one failure occurs and the PCU detects a malfunction and stores a DTC.

PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

Symptom 1

When an overcurrent (short circuit current) passes through the IGBT at the voltage control unit (VCU) side, the power control unit (PCU) detects a trouble (SC) with the GDIC function and, at the same time when outputting a failure information (SC) to the high-voltage microcomputer, blocks a gate signal. The failure information (SC) from the GDIC is released after a specified time has elapsed if the failure is restored to normal. If a specified number of SC signals are issued, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 2

When a trouble with the power supply which drives the IGBT at the VCU side occurs, the PCU detects a trouble (F15V) with the GDIC function and, at the same time when outputting a failure information (F15V) to the high-voltage microcomputer, blocks a gate signal. If an F15V signal detects a trouble for the specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Symptom 3

If the high-side IGBT of the VCU fails (is turned off), a V2 overvoltage or V0 overvoltage occurs at regeneration operation. If a V2 overvoltage or V0 overvoltage occurs in specified times, the motor control module in the PCU detects a malfunction and stores a DTC.

PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The power control unit (PCU) monitors the reactor temperature sensor value to prevent malfunction of the reactor due to heat generation. If the reactor temperature sensor output voltage is a specified voltage for a specified time, the motor control module in the PCU detects a malfunction and stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2.0 seconds or more

DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum

Malfunction Threshold

The reactor temperature sensor output voltage is more than 4.82 V for at least 2.0 seconds.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- PCU internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the motor control module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U0029-00 (VSA CONTROL UNIT)

DTC U0029-00 : CAN Communication Failure (Bus OFF Ch 1)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.

- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 2 seconds
DTC Type	• 1 drive cycle • Brake system indicator (red) blink • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Stop CAN function (Dependant upon the conditions) • Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Degrade hydraulic boost failure compensation function • Stop electric parking brake function (some of function)
Possible Cause	• Open, short to ground, short to power, or short to another line between the VSA modulator-control unit and other control units (F-CAN lines) • Internal failure of other unit on F-CAN • VSA modulator-control unit internal failure

DTC U0038 (MOTOR CONTROL MODULE)

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.
Execution	Regular Diagnosis
Duration	About 1 second
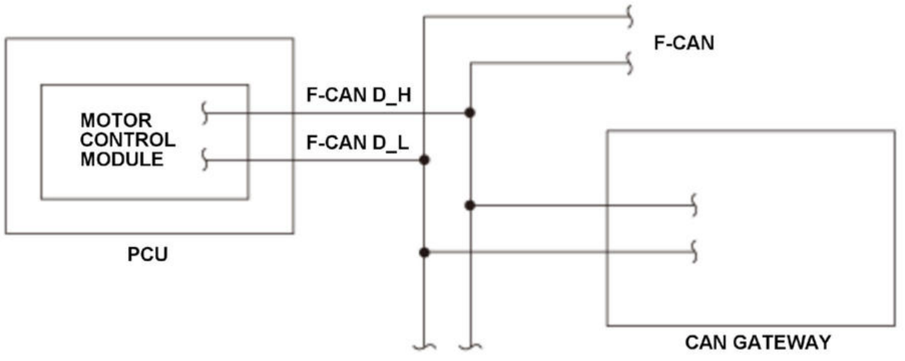
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • VSA indicator on
Fail Safe Action	• Degrade ABS performance • Stop engine drag torque control function • Stop TCS function • Stop VSA function • Stop agile handling assist function • Degrade hydraulic boost failure compensation function (Dependant upon the conditions) • Stop electric parking brake function (some of function)
Possible Cause	• Open or poor connection between the VSA modulator-control unit and the electric servo brake control unit (F-CAN lines) • Electric servo brake control unit internal failure • VSA modulator-control unit internal failure

DTC U0146 (MOTOR CONTROL MODULE)

DTC U0146: F-CAN Malfunction (Traction Motor Control Module - CAN Gateway)

General Description



PCU is composed of motor control module, MPI module, and motor/generator phase current sensor

The controller area network (CAN) transmits/receives pulsing signals to/from the control modules simultaneously by using two signal lines (H line and L line). When the motor control module in the power control unit (PCU) does not receive the signals from the CAN gateway via the F-CAN lines or the received data is abnormal for a specified time, a malfunction is detected and a DTC is stored.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	2 seconds or more
DTC Type	Two drive cycles, MIL on, POWER SYSTEM indicator on

Enable Conditions

Condition	Minimum	Maximum
Elapsed time after the vehicle condition is turned to the ON mode	5 seconds	-
12 volt battery voltage	10 V	-

Malfunction Threshold

One of these conditions is met for at least 2 seconds:

- The motor control module does not receive any signals via the F-CAN lines.
- The information sent from the CAN gateway is abnormal.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- F-CAN circuit F-CAN D_H line open
- F-CAN circuit F-CAN D_L line open
- F-CAN circuit F-CAN D_H line short to ground
- F-CAN circuit F-CAN D_L line short to ground
- Unit communicating on F-CAN internal circuit failure
- CAN gateway failure
- PCU internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the motor control module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U0151-00 (VSA CONTROL UNIT)

DTC U0151-00 : CAN Communication Failure with SRS

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.
Execution	Regular Diagnosis
Duration	About 2 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on • ABS indicator on (Dependant upon the conditions) • VSA indicator on (Dependant upon the conditions)
Fail Safe Action	• Stop ABS function (Dependant upon the conditions) • Stop engine drag torque control function (Dependant upon the conditions) • Stop TCS function (Dependant upon the conditions) • Stop VSA function (Dependant upon the conditions) • Stop agile handling assist function (Dependant upon the conditions)

	• Stop hydraulic boost failure compensation function (Dependant upon the conditions) • Stop electric parking brake function (some of function)
Possible Cause	• Open or poor connection between the VSA modulator-control unit and the SRS unit (F-CAN lines) • SRS unit internal failure • VSA modulator-control unit internal failure

DTC U0155-00 (VSA CONTROL UNIT)

DTC U0155-00 : CAN Communication Failure with Meter

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

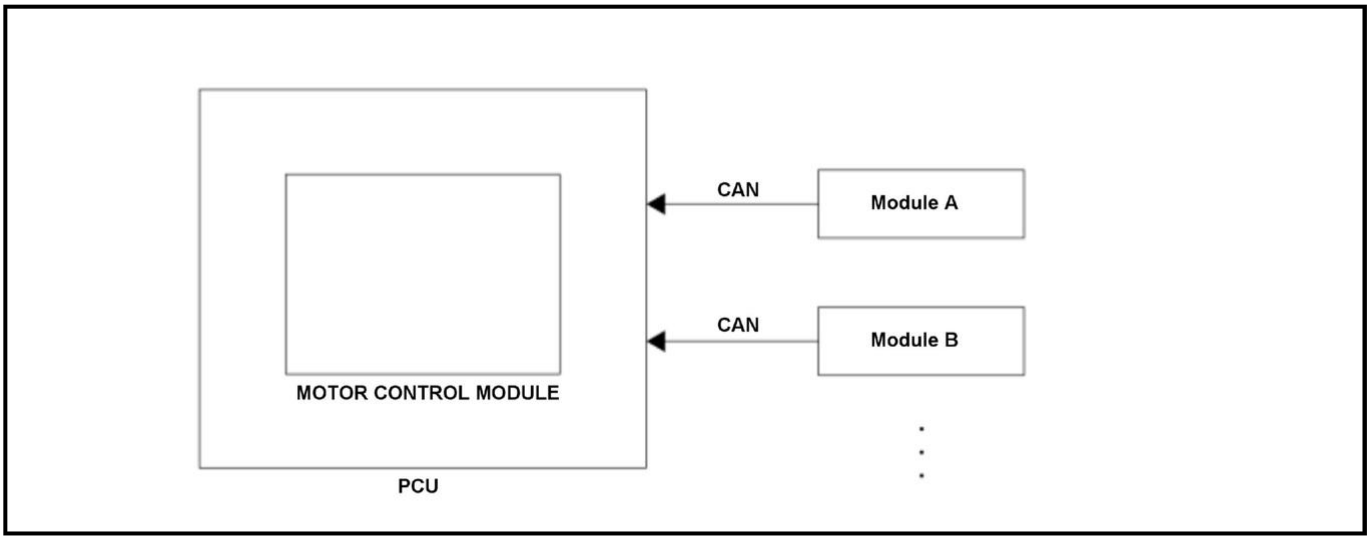
Duration	About 5 seconds
DTC Type	• 1 drive cycle • Brake system indicator (amber) on (Dependant upon the conditions) • VSA indicator on (Dependant upon the conditions)
Fail Safe Action	• Degrade ABS performance (Dependant upon the conditions) • Stop engine drag torque control function (Dependant upon the conditions) • Stop TCS function (Dependant upon the conditions) • Stop VSA function (Dependant upon the conditions) • Stop agile handling assist function (Dependant upon the conditions) • Stop hydraulic boost failure compensation function (Dependant upon the conditions)

	- Stop electric parking brake function (some of function) (Dependant upon the conditions)
Possible Cause	- Open or poor connection between the VSA modulator-control unit and the gauge control module (F-CAN lines) - Gauge control module internal failure - VSA modulator-control unit internal failure

DTC U0311 (MOTOR CONTROL MODULE)

DTC U0311: Traction Motor Control Module Programming Error (Version Mismatch)

General Description



The motor control module in the power control unit (PCU) can be updated by a software rewriting device connected via CAN lines. Each control module has program version information as ROM values and compares its own with the others by transmitting/receiving the values via CAN lines. The PCU needs to be updated with the other modules. If the PCU detects that its own software is not the latest version, the warning indicator comes on and the motor control module stores a DTC.

Monitor Execution, Sequence, Duration, DTC Type

Execution	Continuous
Sequence	None
Duration	1.0 second or more
DTC Type	One drive cycle, MIL on, POWER SYSTEM indicator on

Enable Conditions

Condition	Â
Vehicle	ON mode

Malfunction Threshold

The motor control module detects that its own software is not the latest version for at least 1.0 second after comparing program version information.

Possible Cause

NOTE: The causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

- Program version mismatch between the motor control module and other control modules

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected, the MIL comes on and a Pending DTC, a Confirmed DTC, and the freeze data are stored in the motor control module memory.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U0401-68 (VSA CONTROL UNIT)

DTC U0401-68 : (ECM Failure)

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.

- F-CAN circuit F-CAN D_L line short to ground
- Unit communicating on F-CAN internal circuit failure
- Battery condition monitor module failure
- PCU internal failure

Diagnosis Details

Conditions for setting the DTC

When a malfunction is detected during the first drive cycle, a Pending DTC is stored in the motor control module memory. If the malfunction returns in the next (second) drive cycle, the MIL comes on and a Confirmed DTC and the freeze data are stored.

Conditions for clearing the DTC

The MIL is cleared if the malfunction does not return in three consecutive trips in which the diagnostic runs. The MIL, the Pending DTC, the Confirmed DTC, and the freeze data can be cleared with the scan tool Clear command.

DTC U3000-49 (VSA CONTROL UNIT)

DTC U3000-49 : ECU Internal Circuit Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	Basic Condition: • 12 volt battery voltage 9.6 - 16.5 V • ABS/VSA function not in operation With the Driving Pattern: • Turn the vehicle to the READY TO DRIVE mode.

	- Test-drive the vehicle at 25 mph (40 km/h) or more. (Be careful of the surrounding traffic conditions.)
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (red) on or blink (Dependant upon the conditions) - Brake system indicator (amber) on (Dependant upon the conditions) - ABS indicator on (Dependant upon the conditions) - VSA indicator on (Dependant upon the conditions)
Fail Safe Action	- Stop CAN function (Dependant upon the conditions) - Stop EBD function or Degrade EBD performance (Dependant upon the conditions) - Stop ABS function (Dependant upon the conditions) - Stop engine drag torque control function (Dependant upon the conditions) - Stop TCS function (Dependant upon the conditions) - Stop VSA function (Dependant upon the conditions) - Stop agile handling assist control function (Dependant upon the conditions) - Stop hydraulic boost failure compensation function (Dependant upon the conditions) - Stop electric parking brake function (some of function) (Dependant upon the conditions)
Possible Cause	- VSA modulator-control unit internal failure

DTC U3000-51 (VSA CONTROL UNIT)

DTC U3000-51 : ECU Software Update Failure

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern:

	- Turn the vehicle to the ON mode.
Execution	Initial Diagnosis/Regular Diagnosis
Duration	About 1 second
DTC Type	- 1 drive cycle - Brake system indicator (red) on (Dependant upon the conditions) - Brake system indicator (amber) on (Dependant upon the conditions) - ABS indicator on (Dependant upon the conditions) - VSA indicator on (Dependant upon the conditions)
Fail Safe Action	- Stop CAN function - Stop EBD function - Stop ABS function - Stop engine drag torque control function - Stop TCS function - Stop VSA function - Stop agile handling assist function - Stop hydraulic boost failure compensation function - Stop electric parking brake function
Possible Cause	- VSA modulator-control unit program not the latest - VSA modulator-control unit internal failure

DTC U3003-16 (VSA CONTROL UNIT)

DTC U3003-16 : Electric Parking Brake Control Unit Power Source Circuit (+B) Low Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.

Confirmation Procedure	With the Driving Pattern: - Turn the vehicle to the READY TO DRIVE mode. - Wait 15 seconds or more.
Execution	Regular Diagnosis

Duration	About 15 seconds
DTC Type	- 1 drive cycle - Brake system indicator (red) blink (Dependant upon the conditions) - Brake system indicator (amber) on
Fail Safe Action	- Stop electric parking brake function (some of function)
Possible Cause	- Poor connection between the VSA modulator-control unit and the under-hood fuse/relay box (+B_ABS/VSA_FSR line) - Electric powertrain system failure - Abnormal 12 volt battery - VSA modulator-control unit internal failure

DTC U3003-17 (VSA CONTROL UNIT)

DTC U3003-17 : Electric Parking Brake Control Unit Power Source Circuit (+B) High Voltage

NOTE

- Initial Diagnosis:

  The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

DTC C0010-49 : Inlet Solenoid (Left Front) Circuit Failure

NOTE

- Initial Diagnosis:

The initial on-board diagnosis occurs right after the vehicle condition is turned to the ON mode, and the ABS/VSA indicator comes on, and continues until the indicator goes off.

- Regular Diagnosis:

  The regular on-board diagnosis begins right after the ABS/VSA indicator goes off, and it continues until the vehicle condition is turned to the OFF (LOCK) mode.

- Review "How to troubleshoot the VSA system" before doing the DTC troubleshooting procedure.
- Test-drive the vehicle according to local traffic conditions and regulations. Do not test-drive on a lift unless specified.
- The possible causes shown may not be a complete list of all potential problems, and it is possible that there may be other causes.
